WIUT HACKATHON 26 · COMPUTER VISION TRACK

91 computer-vision startup ideas

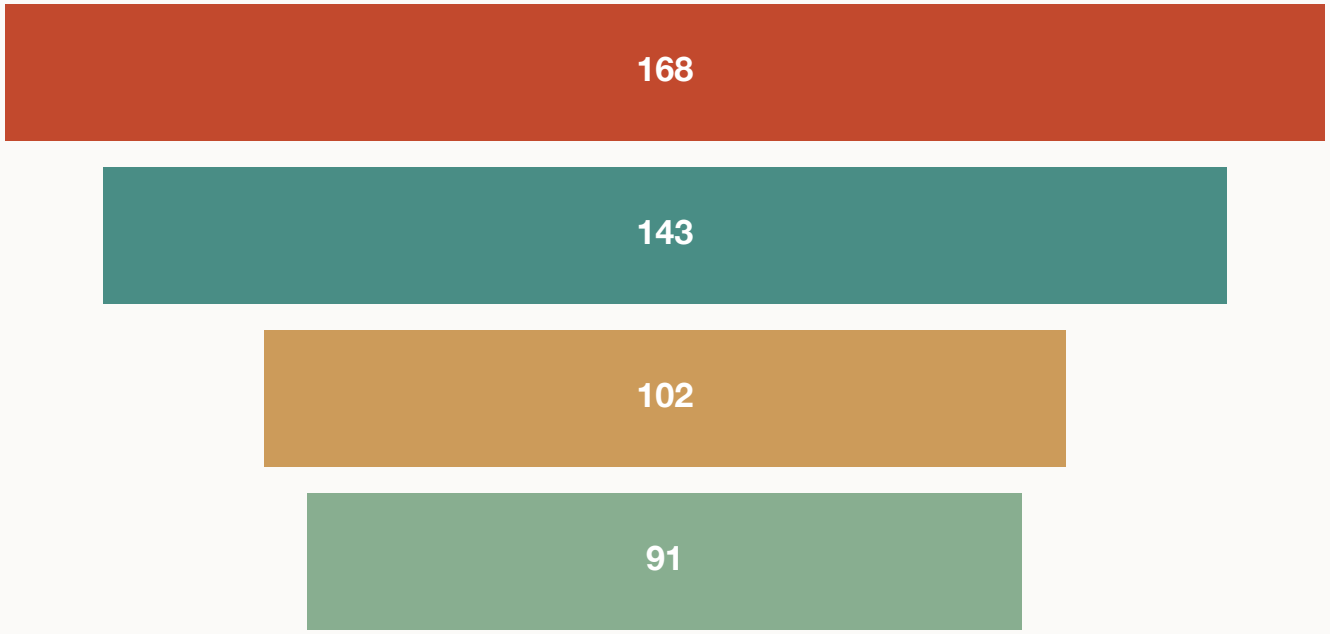

Ranked for an investor jury. Two pages per idea: the idea in plain words, then how it works and what it costs.

Team UsedByAI · Tashkent · 10 October 2026

168 generated → 143 checked by web-searching skeptics → 91 kept

METHOD

How the list was built

Raw ideas
from 10 generator agents

Unique ideas
after de-duplication

Survived skeptics
41 killed after web checks

In this deck
9 famous moved out, 2 pairs merged

Every idea was checked against the web for existing products. Every price is an estimate until a customer confirms it.

Report: Automotive CV hackathon ideas (10 Oct 2026); ideation workflow run

ORDER

Three tiers, ranked for investors

TIER	WHAT IT MEANS	IDEAS
A · Fundable stories	Clear payer, repeat revenue, strong moat	26
B · Solid B2B niches	Real payers, smaller markets, good modules	29
C · Hard investor case	City-only payer, small ticket or a feature	36

Ranking re-weights the verifiers' scores for investors (business and moat count double). Related modules sit right after their lead idea.

ANATOMY

How to read each idea

PAGE	WHAT IT TELLS YOU
1 · The idea, left	What it does and why it matters
1 · The idea, right	Use cases and who buys it
2 · How it works	Four steps; the red box is the decision
2 · The cards	The key number, the build, price, demo
2 · Bottom note	Why it is hard to copy, report score
Both · Eyebrow	Tier and rank out of 91

TIER A · 26 IDEAS

Fundable stories

Clear payer, repeat revenue, a moat that compounds and a market beyond Uzbekistan. Pitch one of these.

PledgePulse

A monthly check that a car bought on credit still exists and is in safe hands.

WHAT IT DOES

Once a month, the borrower gets a Telegram link and films the car for 30 seconds while following random instructions, like "touch the left mirror" or "show the odometer". The app checks it is the right car, filmed live right now, not an old video or a screen.

WHY IT MATTERS

The car is the bank's only safety net, yet nobody looks at it again after the loan is signed. This replaces costly field visits with a 30-second video.

USE CASES

- A bank checks thousands of car loans a month without field visits
- A leasing firm spots a car that was secretly sold
- A lender catches someone filming a screen instead of the real car

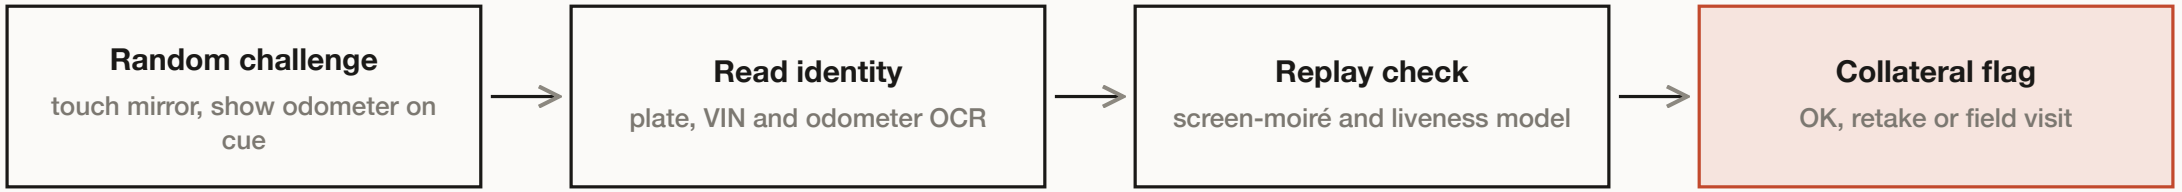

WHO BUYS IT

Banks, leasing companies and microfinance lenders that give car loans.

PledgePulse

A monthly 30-second challenge video on Telegram proves a pledged car still exists, is the right car and is filmed live.

HOW IT WORKS

WHY IT MATTERS

Auto loans reached 34.6 trn UZS in Jan–Nov 2023. Truepic and DoxAI verify an asset once at origination; no monthly re-verification product was found. MKBANK, Uzcard and the Central Bank are partners.

HOW PRACTICAL

60 campus cars in varied light; spoof clips come free by filming laptop screens. Server check in a few seconds on one T4, under $0.02.

WHO PAYS

Banks and lessors, ~6,000 UZS per monthly check, recurring per loan.

JUDGE DEMO

Random challenge on a toy car, then film a laptop screen: replay caught.

Moat — per-car baselines plus a published red-team table of the attacks it catches · Report score 66/100

Quvvat

Tells the buyer of a used electric car how healthy its battery really is.

WHAT IT DOES

The buyer takes four photos: the dashboard and the charger screen, before and after a 15-minute charge. From the energy that went in and how much the range moved, Quvvat estimates the battery's real capacity and gives a simple grade with a fair-price hint.

WHY IT MATTERS

The battery is the most expensive part of an EV and it wears out. Most used EVs here are Chinese imports that normal diagnostic apps cannot read.

USE CASES

- A buyer checks a used BYD before paying
- A bank sets a fair loan amount for a used EV
- A dealer proves its trade-in EVs are healthy

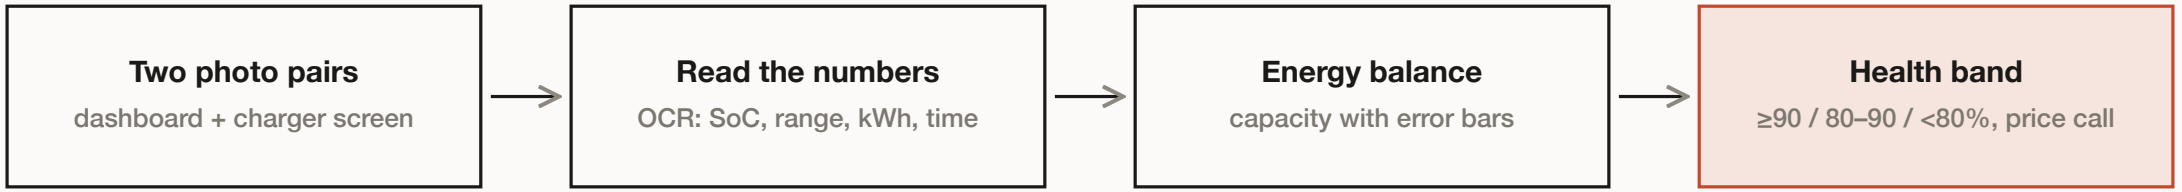

WHO BUYS IT

Used-car dealers, car inspectors and banks that finance electric cars.

Quvvat

Battery-health band for used Chinese EVs from dashboard and DC-charger screen photos before and after a 15-minute charge.

HOW IT WORKS

WHY IT MATTERS

122.7k EVs are registered, 72% in Tashkent; 99.2% of H1-2026 EV imports are Chinese, and OBD apps like EVScanner skip BYD. BYD Royal Motors sponsors the hackathon.

HOW PRACTICAL

25+ logged sessions on friends' BYD and Chery cars, synthetic dashboards, spec sheets. CPU OCR ~0.3 s per image, about $0.002 per check.

WHO PAYS

Dealers, avtopodbor firms and EV-loan banks, ~30k UZS per check.

JUDGE DEMO

Upload our photo pairs: health band plus a listing-mismatch flag.

Moat — a model × charger calibration table that improves with every check · Report score 69/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [2][13][14][15]

Yorliq

Reads the Chinese label on an imported EV and tells you which battery it really has.

WHAT IT DOES

Many Chinese EV models are sold with two or three battery sizes that look identical from outside. You photograph the small metal label (nameplate) inside the car; Yorliq reads the Chinese text and tells you the exact version and battery size.

WHY IT MATTERS

Sellers sometimes advertise the big battery while selling the small one, and a VIN check does not show the battery size. A wrong battery means overpaying by thousands of dollars.

USE CASES

- A buyer checks that the "big battery" in an ad is real
- A dealer documents grey-import EVs before selling
- Quvvat uses it to know the battery's original size

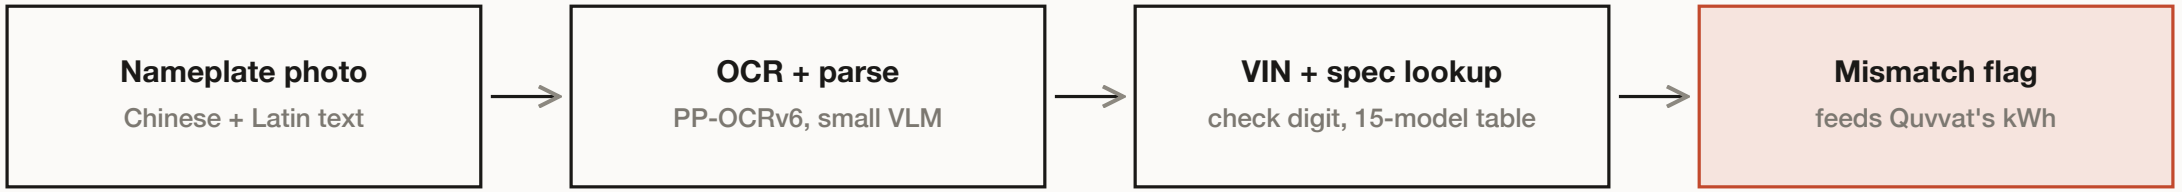

WHO BUYS IT

Used-EV dealers, importers, car inspectors and banks; it also powers Quvvat.

Yorliq

Decodes the Chinese nameplate of a grey-import EV into variant and nominal kWh, flagging listings that claim the wrong pack.

HOW IT WORKS

WHY IT MATTERS

BYD VIN decoders give plant and date, not kWh: one Atto 3 body ships with 49.92, 60.48 or 74.8 kWh packs. Chinese brands took 17.8% of Jan–Jul 2026 sales.

HOW PRACTICAL

Start with ~10 real cars (kill if the plate does not identify the pack), 2,000 synthetic plates, a hand-built table for 15 models. Server CPU ~0.3 s, under $0.001.

WHO PAYS

Inside Quvvat; ~15k UZS per plate standalone for dealers and banks.

JUDGE DEMO

Photograph our printed nameplate card: variant, kWh, mismatch.

Moat — a verified-mismatch database of listings that misstate the battery · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [47][48][50]

FlipperFinder

Exposes dealers who pretend to be private sellers on car marketplaces.

WHAT IT DOES

FlipperFinder ignores the car in each listing photo and looks at the background: the same wall, gate or garage. When dozens of "private" ads were all shot in the same yard, it groups them and shows that one dealer is behind them.

WHY IT MATTERS

Buyers trust private sellers more and pay accordingly, and marketplaces charge dealers higher fees. Hidden dealers cheat both, and today people spot them only by eye.

USE CASES

- A marketplace makes hidden dealers pay dealer fees
- A buyer sees that a "private" car comes from a reseller
- Moderators review fake private ads faster

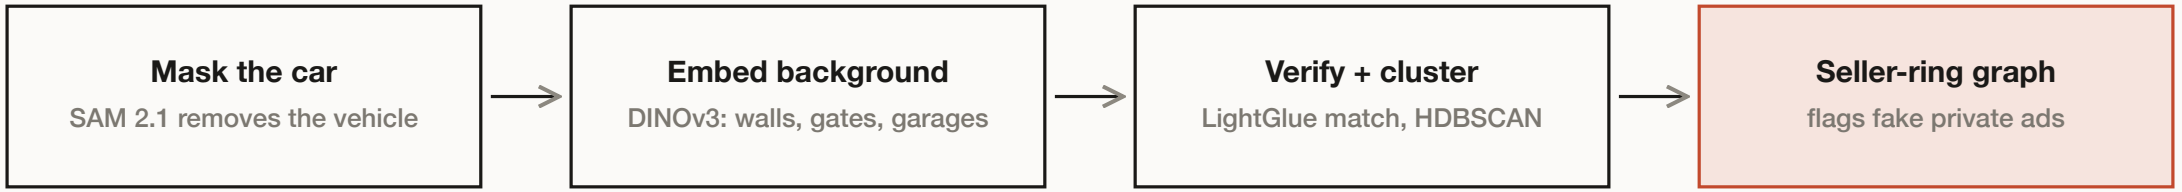

WHO BUYS IT

Car marketplaces such as OLX and Avtoelon.

FlipperFinder

Masks out the car and matches listing-photo backgrounds to expose "private sellers" who are really dealer rings.

HOW IT WORKS

WHY IT MATTERS

The same-parking-lot tell is a known human red flag and Auto.ru already moves hidden resellers to paid terms, yet no automated matcher was found.

HOW PRACTICAL

2,000 public listing photos (faces and plates blurred); OLX.uz's Business filter gives free dealer ground truth. One T4 embedding per photo, under $0.001 per listing.

WHO PAYS

Marketplaces: ~5M UZS/month pilot plus a share of recovered dealer fees.

JUDGE DEMO

Paste five listing photos: shared backgrounds and the seller graph.

Moat — a seller graph that accumulates with every listing scanned · Report score 68/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [29][30][31]

CarTrail

A car history report built from old and current online listings.

WHAT IT DOES

The same car is often sold several times, on OLX, Avtoelon and Telegram. CarTrail recognises the car across listings by its dents, rims, stickers and plate pieces, then shows its past prices, mileage and sellers on one timeline.

WHY IT MATTERS

Uzbekistan has no Carfax-style history service. If the mileage went down between two listings, or the car keeps getting resold, the buyer and the bank should know.

USE CASES

- A buyer sees the mileage was lower in last year's ad
- A bank checks a car's history before a loan
- A dealer checks a trade-in's past

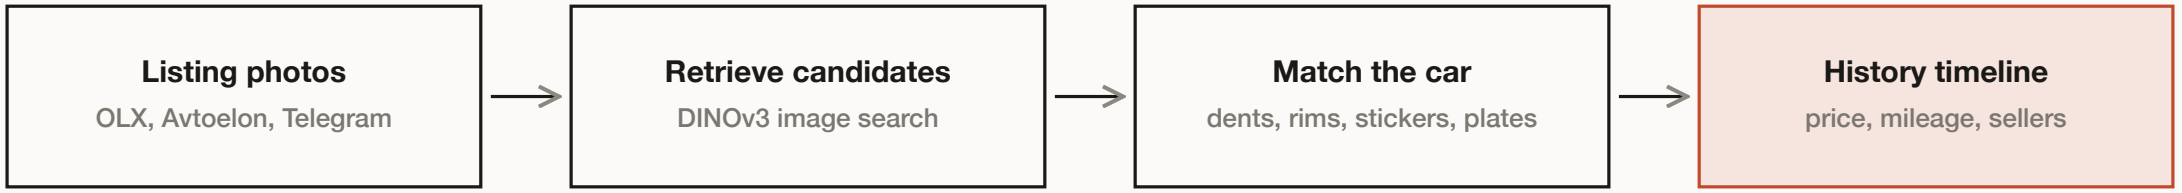

WHO BUYS IT

Banks (per check), car buyers and dealers.

CarTrail

Finds the same car across OLX, Avtoelon and Telegram, flags price, mileage and seller conflicts, and grows a history report.

HOW IT WORKS

WHY IT MATTERS

Russia's Autoteka builds history from Avito's own data; Uzbekistan has no records-based equivalent. OLX alone lists 67,961 car ads to re-identify across platforms.

HOW PRACTICAL

Public listing photos only, hashed embeddings, hosted in-country as the data law requires. T4 embeds once; CPU lookup under 1 s; under $0.002 per report.

WHO PAYS

Banks 8,000 UZS per API call; dealers; buyers 25,000 UZS per report.

JUDGE DEMO

Paste a listing screenshot: matched crops across platforms.

Moat — listings that vanish cannot be backfilled, so the dated archive is unique · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [44][45][46]

TwinCheck

A quick photo test that tells a buyer whether a car needs a full inspection.

WHAT IT DOES

Cars are symmetrical, so the left headlamp, mirror and wheel should age like the right ones. TwinCheck compares each pair in the listing photos. If one side looks newer, that part was probably replaced after a crash.

WHY IT MATTERS

A full inspection costs around 300,000 UZS, too much to do for every car you look at. This cheap first filter tells you which cars deserve it.

USE CASES

- A buyer screens ten listings and inspects only two
- A marketplace adds a "check this car" badge
- Inspectors get pre-qualified customers

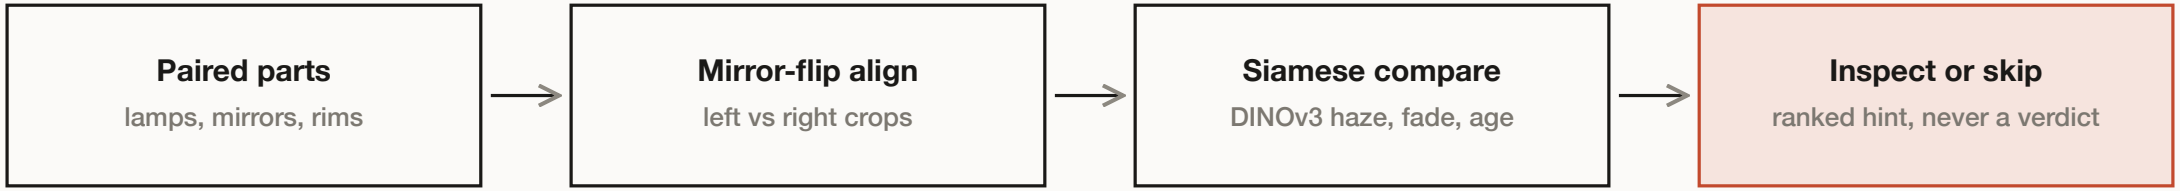

WHO BUYS IT

Car marketplaces, used-car buyers and inspection firms.

TwinCheck

Triage from listing photos: is this car worth a 300,000 UZS inspection? Left-right ageing mismatch hints at repairs.

HOW IT WORKS

WHY IT MATTERS

A Tashkent avtopodbor costs from 300,000 UZS, so buyers need a cheap first filter. UVeye patents symmetry checks and Auto.ru flags poor repairs: check freedom to operate.

HOW PRACTICAL

≥100 avtopodbor-labelled pairs; report coverage and AUC honestly. Server batch, ~$0.0001 per listing.

WHO PAYS

Marketplaces ~100 UZS per listing; buyers 5,000 UZS per check.

JUDGE DEMO

Photograph both headlamps of a parked car: mismatch score.

Moat — listing-to-inspection outcome pairs nobody else collects · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [34][49][192]

WearTruth

Spots a car whose odometer has been rolled back, from photos of its interior.

WHAT IT DOES

A steering wheel, pedals and driver's seat wear down with every kilometre. WearTruth photographs them, estimates how far the car has really been driven, and compares that with the odometer. It also spots marks left by old taxi stickers.

WHY IT MATTERS

Rolled-back odometers and ex-taxis sold as "family cars" make buyers and banks overpay. Interior wear is hard to fake.

USE CASES

- A bank checks mileage before approving a car loan
- A trade-in desk avoids overpaying for a worn car
- A buyer finds out a car used to be a taxi

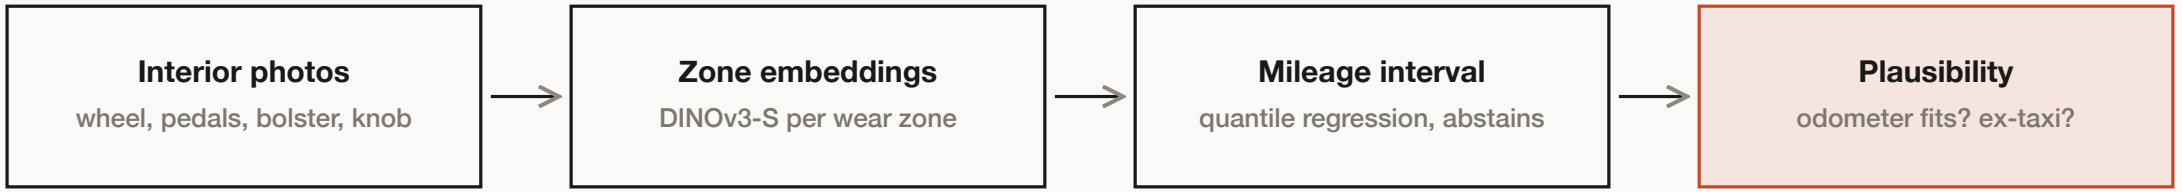

WHO BUYS IT

Auto-loan banks and dealers' trade-in desks.

WearTruth

Mileage band from interior wear (wheel, pedals, bolster, gear knob) checked against the odometer, plus a former-taxi flag.

HOW IT WORKS

WHY IT MATTERS

Interior wear is independent evidence against odometer rollback. 576k taxi drivers registered as self-employed in 2024, so ex-taxi cars reach resale. OdoShield and AI Vahan lack local labels.

HOW PRACTICAL

30+ GPS-logged disposals from a taxi or leasing fleet; count taxi-decal ghosts on 100 cars first. In-browser WebGPU, ~zero cost.

WHO PAYS

Banks and trade-in desks via API, 8,000 UZS per check.

JUDGE DEMO

Photograph your wheel and pedals and play guess-the-mileage.

Moat — fleet-labelled wear curves for local models · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [26][51]

Trim Truth

Checks that a used-car ad's equipment level matches what the car really has.

WHAT IT DOES

The same model, like a Cobalt, comes in cheap and expensive versions. Trim Truth looks at photos and checks the visible clues, such as wheels, sunroof, roof rails and rear camera, then marks whether the advertised version matches the car.

WHY IT MATTERS

Sellers often claim a higher version to raise the price. Buyers and banks then pay too much for a basic car.

USE CASES

- A marketplace shows an "ad matches the car" badge
- A buyer checks a "top version" claim from photos
- A bank avoids lending on an inflated price

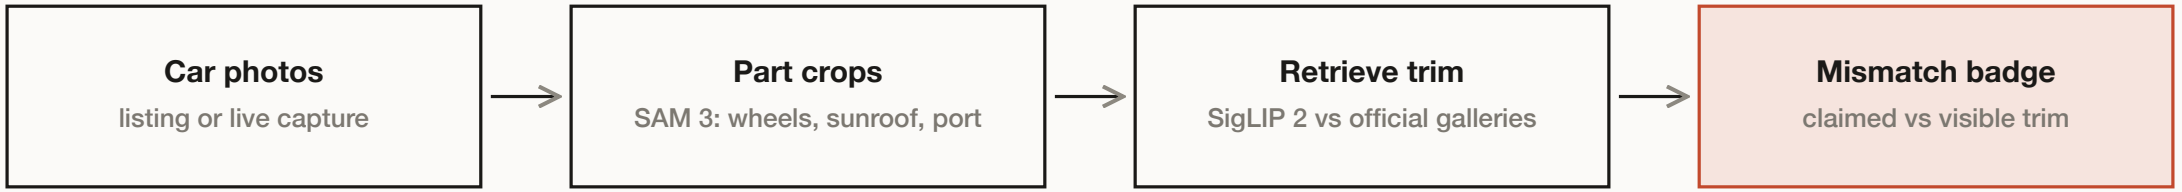

WHO BUYS IT

Car marketplaces, and banks once a loan officer confirms the problem.

Trim Truth

An "ad vs reality" badge that verifies only camera-visible trim claims on Cobalt LS/LT/LTZ and BYD variants.

HOW IT WORKS

WHY IT MATTERS

Overstated trims inflate asks. Auto.ru grades condition, not trim; Chinese brands took 17.8% of Jan–Jul 2026 sales, multiplying variants to check.

HOW PRACTICAL

UzAuto and BYD galleries, 1,000 listing photos, 50 own cars. Browser retrieval, server ~1.5 s, ~$0.004.

WHO PAYS

Marketplaces; banks only if a loan officer confirms trim inflation.

JUDGE DEMO

Photograph your own car: model, equipment and trim appear.

Moat — a local trim taxonomy no global vendor maintains · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [49][50]

TruckProof

Proves a truck and driver are real before they get a cargo load.

WHAT IT DOES

Before booking a load, the freight forwarder sends the driver a link. The driver films the truck, its plate, the documents and a fresh random code. TruckProof checks that the plate, the papers, the truck type and the driver's face all match.

WHY IT MATTERS

Many loads in Central Asia are booked through Telegram groups where anyone can claim to be a carrier. A fake carrier can disappear with the cargo.

USE CASES

- A forwarder verifies a new carrier in two minutes
- A Telegram freight group shows a "verified" badge
- A cargo insurer requires a check before trips

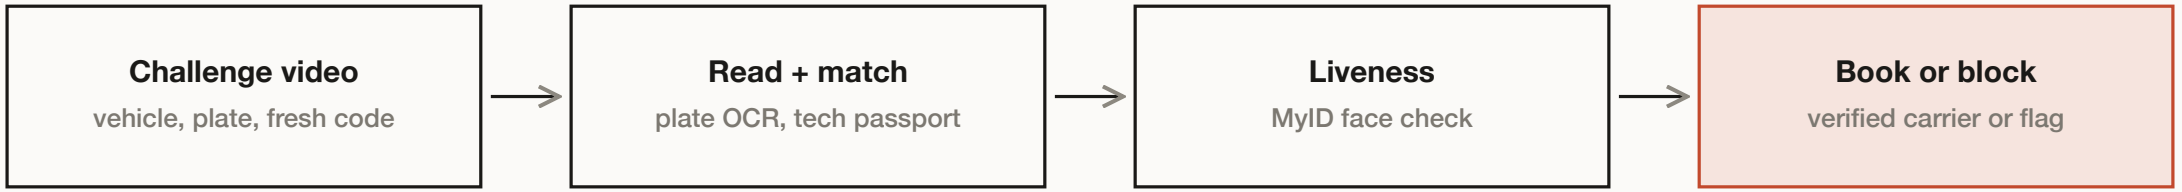

WHO BUYS IT

Freight forwarders, logistics marketplaces and cargo insurers.

TruckProof

A 20-second challenge video matches truck plate, registration document, vehicle type and driver before a load is booked.

HOW IT WORKS

WHY IT MATTERS

Loads are booked through Telegram freight groups. Overhaul and KYT verify photos or licences, not a live plate–document–vehicle match. MyID reports 19M+ users.

HOW PRACTICAL

Mock documents, 100 consented vehicle videos, the Central Asia plate set (CC BY). Server ~2 s per video, ≈$0.002.

WHO PAYS

Forwarders and Telegram freight marketplaces, $0.50 per verification.

JUDGE DEMO

Film your own car, plate and the random code: matched or failed.

Moat — a shared verified-carrier graph and fraud blacklist that grow with each booking · Report score 69/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [27][28]

Alibi

Proves an insurance claim photo was really taken at the scene, today.

WHAT IT DOES

When a driver sends damage photos to an insurer's Telegram bot, Alibi checks the physics. Do the shadows match the sun's position at that place and time? Does the weather match? Was the photo taken of a real car, not a screen?

WHY IT MATTERS

Fraudsters reuse old photos or edit damage in. Even trained staff miss half of edited damage photos.

USE CASES

- An insurer fast-tracks honest claims and holds suspicious ones
- A claims team catches an old photo sent as new
- Remote claims become safe without an inspector visit

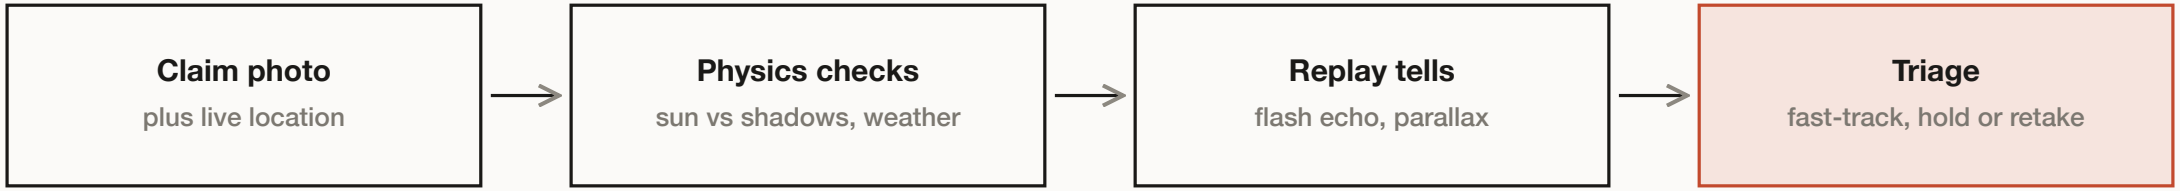

WHO BUYS IT

Car insurers (OSAGO and KASKO claims departments).

Alibi

Photo liveness for Telegram-bot claims: physics checks prove a damage photo was taken now, here, not replayed.

HOW IT WORKS

WHY IT MATTERS

Humans catch only 50% of manipulated damage photos. Amped's SunCalc check is manual; this one is automatic and holds up as image generators improve.

HOW PRACTICAL

300 own timed photos plus an attack set. Server CPU ~1.5 s, ~$0.002 per check; abstains often by design.

WHO PAYS

OSAGO and KASKO claims desks, $0.05–0.20 per claim.

JUDGE DEMO

Photograph your car, claim a false time: the sun overlay rejects it.

Moat — physics-based checks that do not decay as generators improve · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [61][62]

ScratchPrint

Tells whether a scratch is new or was already there before.

WHAT IT DOES

Every scratch and dent has a unique shape, like a fingerprint. ScratchPrint compares new photos with earlier ones and says whether a damage mark is the same old one or a new one.

WHY IT MATTERS

People claim old damage as new, or the same damage twice. Rental and taxi companies argue with drivers about who caused which scratch.

USE CASES

- A taxi fleet settles "who scratched it" at shift change
- An insurer spots damage that existed before the policy
- A rental company checks returns fairly

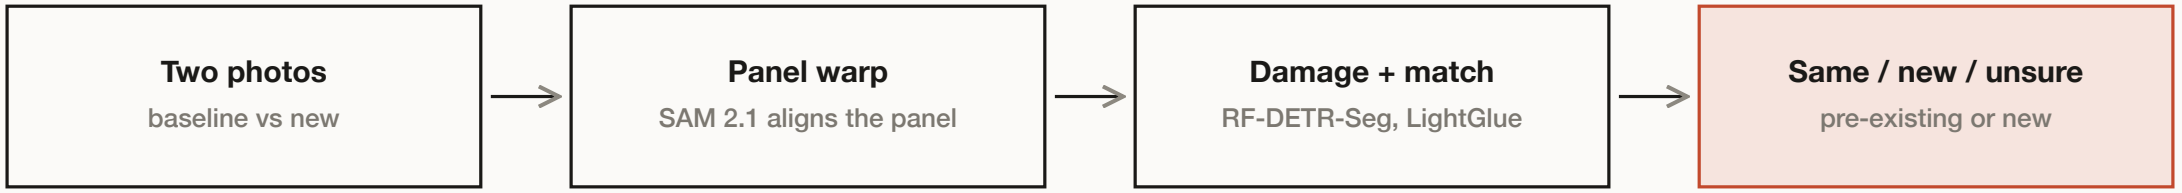

WHO BUYS IT

Insurers, taxi fleets, rental and car-sharing companies.

ScratchPrint

Re-identifies the same physical scratch across photos: same damage or new damage, at handovers and at claim time.

HOW IT WORKS

WHY IT MATTERS

One appraiser reused a photo in 170 claims. Inspektlabs, Click-Ins and Ravin sell baselines; geometry-level re-identification of the damage itself is the gap.

HOW PRACTICAL

AutoDamageIQ (CC BY) plus ~40 self-shot revisit pairs. Modal T4 ~2 s, ~$0.001 per check.

WHO PAYS

Fleets per handover; insurers ~$0.25 per claim.

JUDGE DEMO

Photograph a pre-staged dent twice: same-vs-new verdict.

Moat — an embedding-only registry that grows across insurers via the Guarantee Fund · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [63][64]

BumperMatch

Checks whether the damage on two cars could really come from the same crash.

WHAT IT DOES

Using the licence plate as a ruler, BumperMatch measures how high the damage sits on each car. A dent at knee height cannot come from a bumper that sits much higher, so impossible combinations are flagged.

WHY IT MATTERS

Some accidents are staged or described falsely to get insurance money. A simple height check catches many of them.

USE CASES

- An insurer flags a claim where the dents don't line up
- An independent expert gets measurements for a report
- A hit-and-run victim learns what kind of car hit them

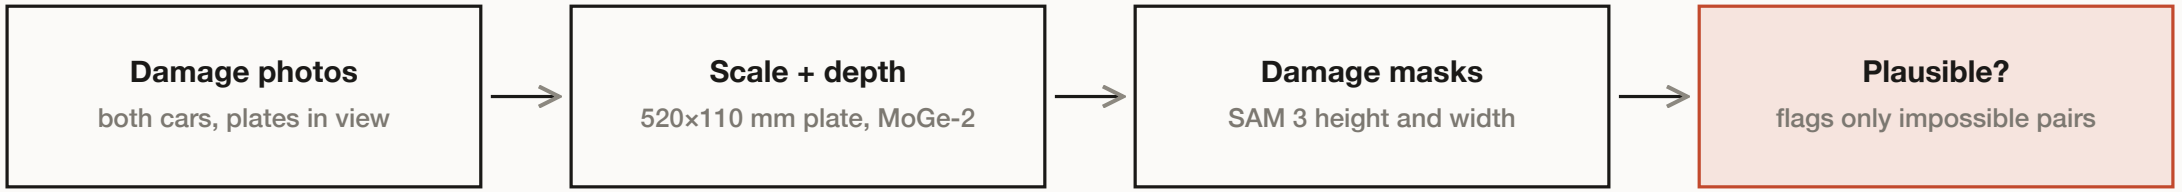

WHO BUYS IT

Car insurers' claims and fraud teams, and independent damage experts.

BumperMatch

Does the damage fit the other car? Plate-scaled height and shape of the damage on both cars flag impossible pairings.

HOW IT WORKS

WHY IT MATTERS

Staged and misdescribed collisions show up as height mismatches. Cobalt took 30.1% of 2025 sales (unofficial source), so a local bumper catalogue covers much of the parc.

HOW PRACTICAL

Tape-measured catalogue of ~25 models; tape vs MoGe-2 error on 30 cars. Server under 3 s, ~$0.001.

WHO PAYS

Claims teams and independent experts, ~$0.30 per two-car check.

JUDGE DEMO

Photograph a scratch near any plate, then pick the other car.

Moat — a measured local bumper-height catalogue · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [58][59][60]

WitnessHunt

Finds dashcam video of an accident from other vehicles that were nearby.

WHAT IT DOES

Taxi and delivery fleets record dashcam video all day. When an insurer needs evidence for a crash, WitnessHunt searches the fleets' footage for that place and time, finds the clip, and blurs faces and plates before sharing it.

WHY IT MATTERS

Many accident disputes come down to one driver's word against the other's. Video settles them fast, and insurers must decide within 15 days.

USE CASES

- An insurer gets video of a disputed crash
- A fleet earns money from footage it already has
- A driver proves the other car ran the red light

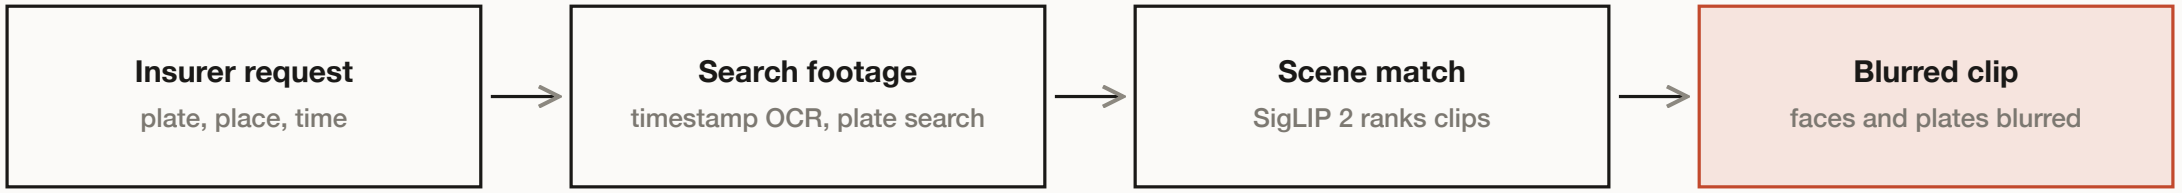

WHO BUYS IT

Insurers pay per clip; fleets join as video suppliers.

WitnessHunt

A B2B exchange matching fleets' stored dashcam footage to insurer disputes by plate and time, with automatic privacy blur.

HOW IT WORKS

WHY IT MATTERS

OSAGO gives insurers 15 days to decide, and footage settles disputes. Singapore's mWitness pays $100 rewards with manual review.

HOW PRACTICAL

~20 volunteers and 10 staged incidents; measure time-to-footage. Server ~1 s per 10 s clip.

WHO PAYS

Insurers and fleets, ~$3–5 per resolved dispute.

JUDGE DEMO

Upload a clip or film a plate on a laptop: footage found.

Moat — a contributor network of fleets that already store video · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [181][182]

EuroScene

Lets two drivers report a small accident with their phones, without police.

WHAT IT DOES

After a minor crash, both drivers film a short walk-around of the scene. EuroScene reads both plates, marks the damage on each car, fills in the accident notice form, and both drivers sign it with a QR handshake.

WHY IT MATTERS

Waiting for police after a fender-bender wastes hours and blocks traffic. A recorded, signed notice is also better evidence for insurers. It does not decide who is at fault.

USE CASES

- Two drivers file a notice in five minutes
- A taxi company handles its drivers' small accidents
- An insurer receives clean, filmed evidence

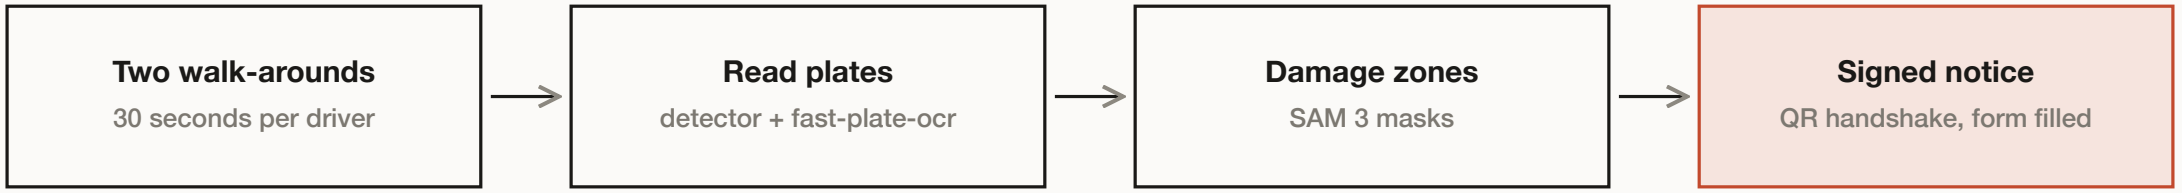

WHO BUYS IT

Insurers, the Insurance Guarantee Fund and ride-hailing fleets.

EuroScene

Two-phone accident notice: both drivers film a walk-around, get a pre-filled notice and sign by QR handshake. No fault call.

HOW IT WORKS

WHY IT MATTERS

The 2026 reform gave the Insurance Guarantee Fund adjuster functions. Ukraine's Diia already files digital accident reports; video-first attestation is the twist.

HOW PRACTICAL

Synthetic Uzbek plates (01 A 123 BC, 01 123 ABC); real plates at night and in rain. Server ~6 s, ~$0.01.

WHO PAYS

Guarantee Fund or NAPP pilot, ride-hailing fleets, ~$0.40 per notice.

JUDGE DEMO

Judge and a neighbour film a toy-car scene and get the notice.

Moat — becoming the accepted evidence format · Report score 50/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [68][69]

WashScan

Turns car washes into places where a car's condition gets photographed and recorded.

WHAT IT DOES

When a car arrives at a wash, the attendant walks around it with a phone. The app makes sure every panel is filmed clearly and saves a dated record of the car's condition, linked to its plate.

WHY IT MATTERS

Car washes are often blamed for scratches that were already there; the record protects them. Insurers also want up-to-date condition photos and can buy these records.

USE CASES

- A car wash proves a scratch was there before washing
- An insurer gets fresh condition photos without an inspector
- A lender sees a car's recent state

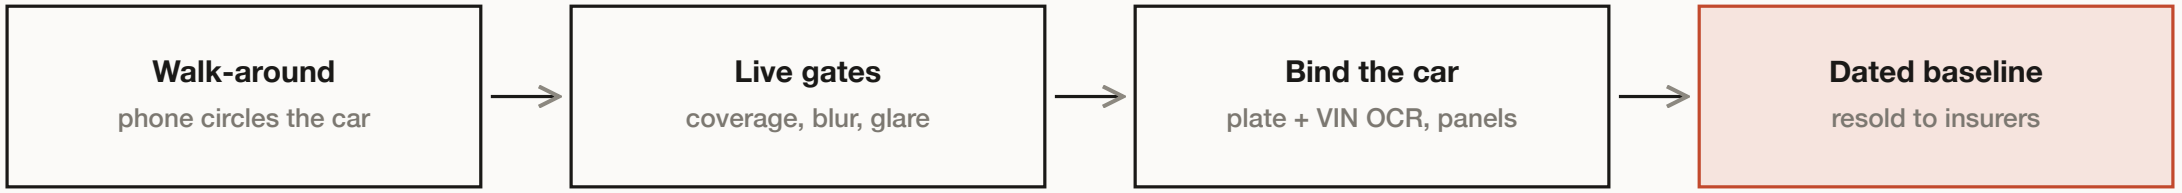

WHO BUYS IT

Car washes first, then insurers who buy the condition records.

WashScan

Car washes become paid inspection stations: the attendant circles the clean car and stores a dated, plate-bound baseline.

HOW IT WORKS

WHY IT MATTERS

Wash-damage vendors sell fixed cameras at $23–63 per camera-month; this needs none. KASKO insurers signed 237,405 contracts in 2025.

HOW PRACTICAL

60 self-filmed walk-arounds at two washes; AutoDamageIQ for damage tags. In-browser gates at a 10+ FPS target; ~$0.001 per baseline.

WHO PAYS

Washes first (claim defence), then insurers ~5,000 UZS per baseline.

JUDGE DEMO

Circle any object: the coverage ring closes.

Moat — a wash network plus a library of dated baselines · Report score 66/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [32][33]

Columbo

A chat assistant that inspects a used car remotely by asking for the right photos.

WHAT IT DOES

A buyer in another city sends Columbo a listing. Columbo asks the seller for one photo at a time, always the one that tells it the most, and runs checks for repairs and repaint. It ends with: buy, walk away, or inspect in person.

WHY IT MATTERS

A professional inspection costs 300,000 UZS plus travel. Most bad cars can be ruled out remotely before anyone travels.

USE CASES

- A buyer in Samarkand checks a car listed in Tashkent
- A dealer screens many cars without visiting them
- Inspectors get only the cars worth a trip

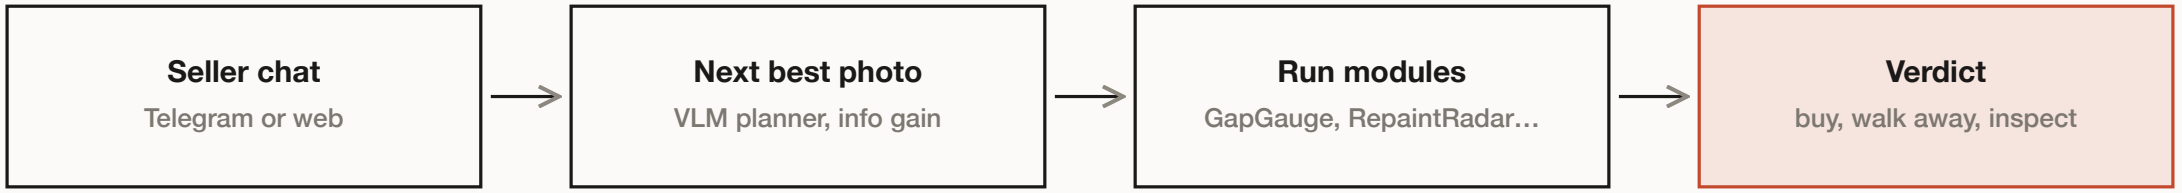

WHO BUYS IT

Used-car buyers in the regions and dealers buying cars from afar.

Columbo

A Telegram AI agent that inspects a car remotely, asking the seller for the most informative next photo until it can decide.

HOW IT WORKS

WHY IT MATTERS

An in-person avtopodbor costs from 300,000 UZS plus travel. Tractable's guided video asks insurers' customers for extra shots; nobody does it for buyers.

HOW PRACTICAL

Inspector likelihoods, 50 team cases, scripted sellers. Server ~$0.01 per case. Must prove fewer photos than a fixed 12-shot protocol.

WHO PAYS

Regional buyers and dealers, 25,000 UZS per case.

JUDGE DEMO

Play the seller from our photo folder; watch each request.

Moat — a questioning policy that improves with every conversation · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [34][41]

BozorLens

A fair-price guide for used cars, built from the prices at car markets.

WHAT IT DOES

At car markets, sellers put price sheets behind the windshield. Walking with a phone, BozorLens reads each sheet, identifies the car, and compares the price with online ads, building a fair-price index over time.

WHY IT MATTERS

Uzbekistan has no trusted price guide, so banks and insurers value cars blind. First check the price sheets really exist at the market.

USE CASES

- A bank values a car before a loan
- An insurer sets the insured value
- A buyer sees if an asking price is fair

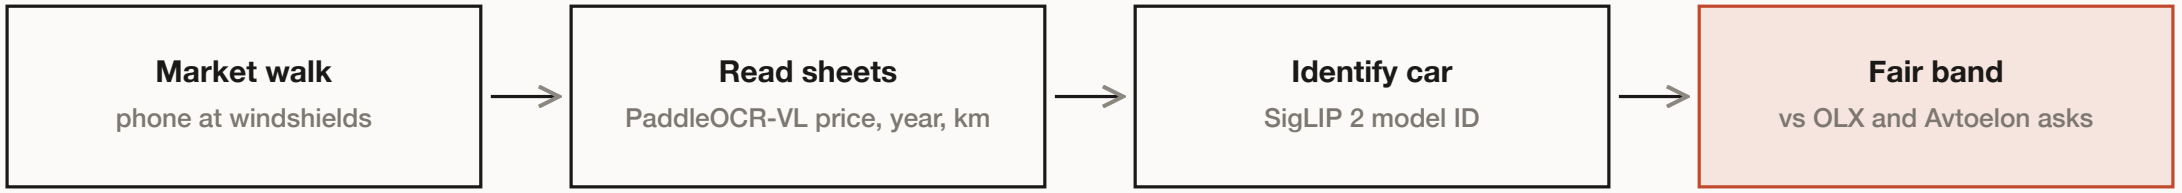

WHO BUYS IT

Banks and insurers via subscription; buyers use it for free.

BozorLens

A fair-price index from offline car markets: read windshield price sheets, identify the car, compare with online asks.

HOW IT WORKS

WHY IT MATTERS

Banks and insurers price collateral without a local price guide. The market logs 5,000–7,000 daily arrivals by plate or QR. The premise is unverified: check first.

HOW PRACTICAL

The first hour at Sergeli decides it: no price sheets, kill. Digits in-browser; hard sheets via VLM ~$0.0003.

WHO PAYS

Banks and KASKO insurers, ~3M UZS/month plus 5,000 UZS per valuation.

JUDGE DEMO

Point a phone at printed sheets on toy cars: fair band.

Moat — offline asking prices cannot be collected after the fact · Report score 67/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [180]

Shtraf Shield

Handles traffic-camera fines for company cars: check, pay early or pass on.

WHAT IT DOES

Fleets with many cars receive many camera fines. Shtraf Shield reads each fine's photo, checks the plate, make and colour match the fleet's car, flags mistakes and cloned plates, then pays early at the discount or transfers the fine to the driver.

WHY IT MATTERS

Paying within 15 days halves the fine, and since April 2026 fines can go to the actual driver. Fleets lose money missing deadlines or paying for wrong fines.

USE CASES

- A car-rental firm transfers fines to customers automatically
- A delivery fleet stops paying for misread plates
- A fleet never misses the 50% discount

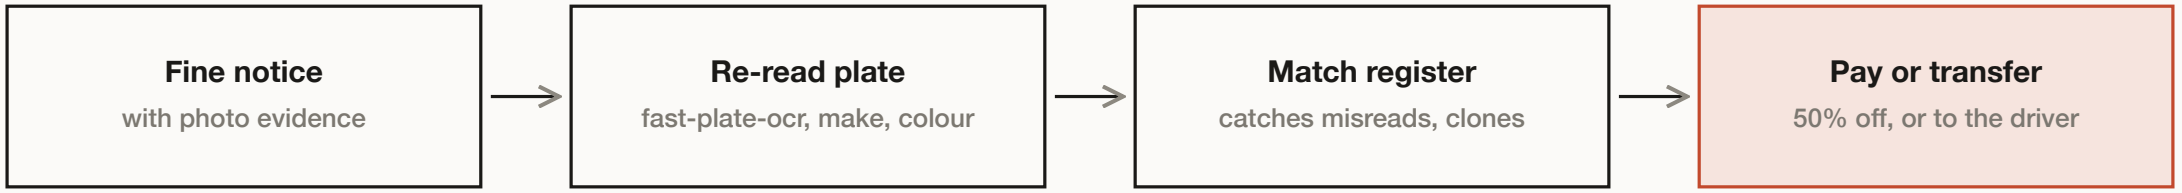

WHO BUYS IT

Rental, car-sharing, taxi and delivery fleets with 50 to 500 cars.

Shtraf Shield

A fine desk for rental, car-sharing and delivery fleets: checks each camera fine, then pays at the discount or transfers it.

HOW IT WORKS

WHY IT MATTERS

Fines can be transferred to the actual driver since 1 Apr 2026, and paying within 15 days halves them. RicorsoAI attacks paperwork, not the evidence image.

HOW PRACTICAL

Central Asia plates (CC BY) plus synthetic mismatches. Server ~1.5 s, ~$0.003 per fine.

WHO PAYS

Fleets of 50–500 cars, ~$1 per vehicle-month.

JUDGE DEMO

Upload a car photo and a mock fine: pay or transfer.

Moat — per-site camera error patterns learned across fleets · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [98][99][100][101]

FuelTruth

Catches fuel theft in company vehicles with one short video at the pump.

WHAT IT DOES

At each refuel, the driver films the pump display, the plate and the odometer in one 10-second clip. FuelTruth reads the numbers, checks them against the receipt and the trip, and flags fills that don't add up.

WHY IT MATTERS

Drivers can inflate receipts or fill other cars on the company's money. Fuel sensors cost money and need installing; a phone video does not.

USE CASES

- A fleet manager sees which fills look suspicious
- A company fills in fuel data for its digital waybill
- A municipal fleet audits fuel spending

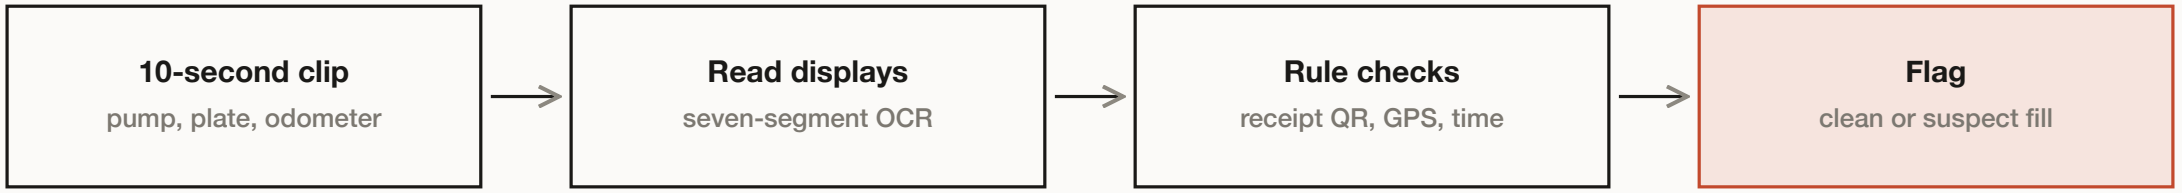

WHO BUYS IT

Corporate, municipal and logistics fleets.

FuelTruth

One 10-second clip (pump display, plate, odometer) fills the e-waybill fuel fields and catches blank-cheque receipts.

HOW IT WORKS

WHY IT MATTERS

The e-waybill must carry fuel quantity, remainder and economy. Fuel-level sensors need hardware; methane costs 5,700–5,800 UZS per m³.

HOW PRACTICAL

50k synthetic pump renders plus consented station photos. Modal T4 ~0.4 s, ~$0.0005 per clip.

WHO PAYS

Corporate, municipal and logistics fleets, $3 per vehicle-month.

JUDGE DEMO

Photograph our pump card, edit one number: the verdict flips.

Moat — a cross-fleet station index · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [108][109][110]

Wrench-Proof

Proves a repair on a company car was really done.

WHAT IT DOES

The mechanic records one continuous 20-second video: the plate, the odometer, the new part's box and the old part removed. Wrench-Proof checks everything is in one take and that the box matches the part, then issues a sealed receipt.

WHY IT MATTERS

Fleet owners pay for oil changes, brake pads and batteries they never see. Today they simply have to trust the mechanic.

USE CASES

- A taxi company checks a garage's invoice
- A delivery fleet keeps a verified service history per car
- A buyer sees proven maintenance on a used fleet car

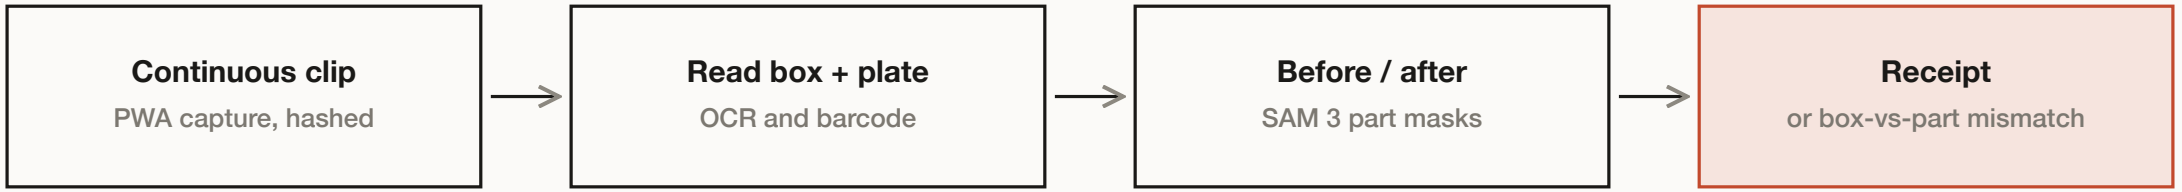

WHO BUYS IT

Taxi parks and delivery fleets.

Wrench-Proof

A 20-second continuous clip proves a repair happened: plate, odometer, new part box and the removed old part in one take.

HOW IT WORKS

WHY IT MATTERS

Fleet owners suspect phantom oil, brake and battery jobs. Service-book apps take the mechanic's word; this is CV-verified. Skip gas kits: UGaz already logs CNG sales.

HOW PRACTICAL

10–15 staged services. Server L4 ~5 s, ~$0.01 per receipt.

WHO PAYS

Taxi parks and delivery fleets, ~$0.10 per receipt.

JUDGE DEMO

Mock filter change; swapping the box fails the check.

Moat — verified service passports per car · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [78][79]

ShiftGate

A 15-second safety check couriers pass before their shift starts.

WHAT IT DOES

Before taking orders, the courier films their scooter or bike for 15 seconds. ShiftGate checks the reflectors, lights, number plate and documents. If something is missing, the shift stays locked and the courier gets a fix list.

WHY IT MATTERS

Couriers' fines in 2026 add up to about 4.7 billion UZS, mostly for missing lights and reflectors. Unsafe bikes are also hard to see at night.

USE CASES

- A delivery app unlocks shifts only for safe bikes
- A courier company cuts its fines
- A platform shows regulators its safety record

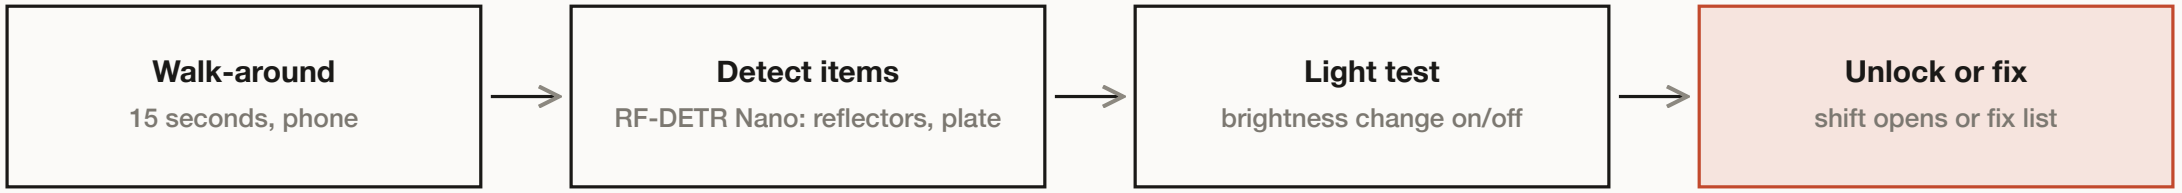

WHO BUYS IT

Delivery platforms and courier companies.

ShiftGate

Courier pre-shift passport: a 15-second walk-around checks reflectors, lights, plate and documents before orders unlock.

HOW IT WORKS

WHY IT MATTERS

2026 courier fines total ~4.7bn UZS. Helbiz and Meituan gate on helmets only; no Uzbek helmet rule was found, so helmets stay secondary.

HOW PRACTICAL

CC BY helmet sets, 300 self-shot clips, FLUX.2 klein dusk edits. In-browser WebGPU; FPS still to measure.

WHO PAYS

Delivery platforms and courier fleets, 2,000 UZS per courier-month.

JUDGE DEMO

Film a bag, bike or scooter: missing items and fine avoided.

Moat — compliance history and rule updates per platform · Report score 65/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [16][122]

Be-Seen

Tests whether a moped's reflectors really shine, using two phone photos.

WHAT IT DOES

The courier takes one photo with flash and one without. Be-Seen compares them: good reflective tape shines brightly under flash, while worn or fake tape does not. It grades each reflector and lists what to replace.

WHY IT MATTERS

Most two-wheeler violations in 2026 were about reflectors and lights. A rider who cannot be seen at night can be hit.

USE CASES

- A depot checks all mopeds before night shifts
- A courier checks their own vest and bike
- A fleet proves its bikes meet the rules

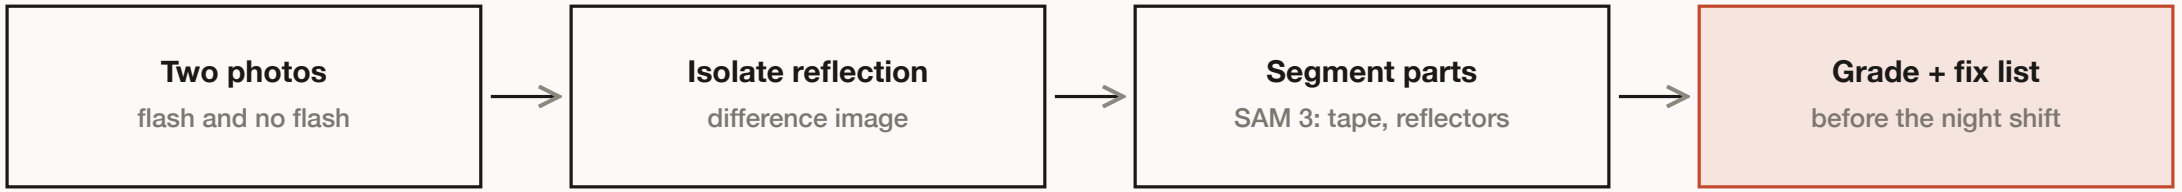

WHO BUYS IT

Delivery platforms and fleets with mopeds and bikes.

Be-Seen

A flash / no-flash photo pair isolates retroreflection and grades a courier moped's reflectors and tape before night shifts.

HOW IT WORKS

WHY IT MATTERS

Yandex says 92% of 23,785 two-wheeler violations in 2026 were reflectors, lights, tint or passengers: ~4.7bn UZS in fines. Retroreflectometers are dedicated hardware.

HOW PRACTICAL

300 flash/no-flash pairs at dusk; certified vs white tape vs paint. In-browser under 1 s, zero server cost.

WHO PAYS

Platforms and fleets, 3,000 UZS per audit or 150k UZS per depot-month.

JUDGE DEMO

Photograph your vest or plate with and without flash.

Moat — per-phone flash calibration and depot compliance history · Report score 67/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [16][17]

CamAudit

Tests whether a traffic camera's AI still reads plates at night, in rain and in dust.

WHAT IT DOES

Companies that install road cameras give CamAudit their footage. It creates realistic night, rain, dust and dirty-plate versions of the clips, runs the company's AI on them and reports where it fails, against the government's rules.

WHY IT MATTERS

Under Resolution 148, cameras must read at least 95% of plates day and night or be switched off. Vendors claim 97-99%, but nobody checks independently.

USE CASES

- A camera vendor tests itself before the official trial
- A city checks a vendor's claims before paying
- An integrator finds weak cameras before they fail

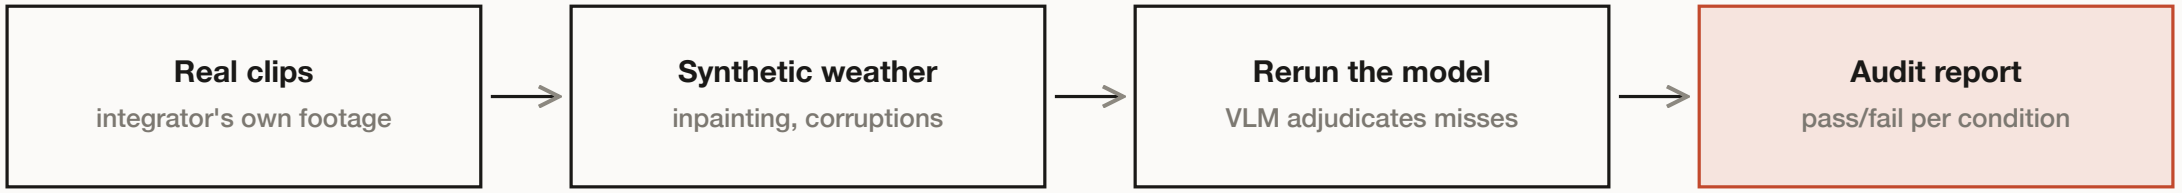

WHO BUYS IT

Companies that install traffic cameras, and later city traffic centres.

CamAudit

Stress-tests road-camera AI under synthetic night, rain, dust and plate smear, scored against Resolution 148.

HOW IT WORKS

WHY IT MATTERS

Resolution 148 demands ≥95% plate capture day and night and suspends use at ≥5% data errors, yet "error" is undefined. Vendors self-claim 97–99%; no independent tester found.

HOW PRACTICAL

ACDC, ZOD, BDD100K, Central Asia plates plus 50 Tashkent clips. 1,000 synthetic frames in ~1 hour on Modal L4 for under $2.

WHO PAYS

Integrators facing the 10-day trial, 15–40M UZS per audit.

JUDGE DEMO

Drag night and rain sliders: plate reader fails; audit downloads.

Moat — a local benchmark with a real-vs-synthetic calibration curve · Report score 70/100

Navbat

A live map of methane (CNG) stations: which are open and how long the queue is.

WHAT IT DOES

Drivers share short videos of station queues. Navbat counts the cars, estimates the waiting time and whether the station is open, and tells taxi drivers where to fill up now.

WHY IT MATTERS

In winter many CNG stations close or have long queues: on 25 Dec 2025, only 11 of 33 stations for Tashkent public transport were open. Every hour in a queue is lost income for a taxi driver.

USE CASES

- A taxi driver goes to the station with the shortest wait
- A fleet plans refuelling for 100 cars
- Station owners see their busy hours

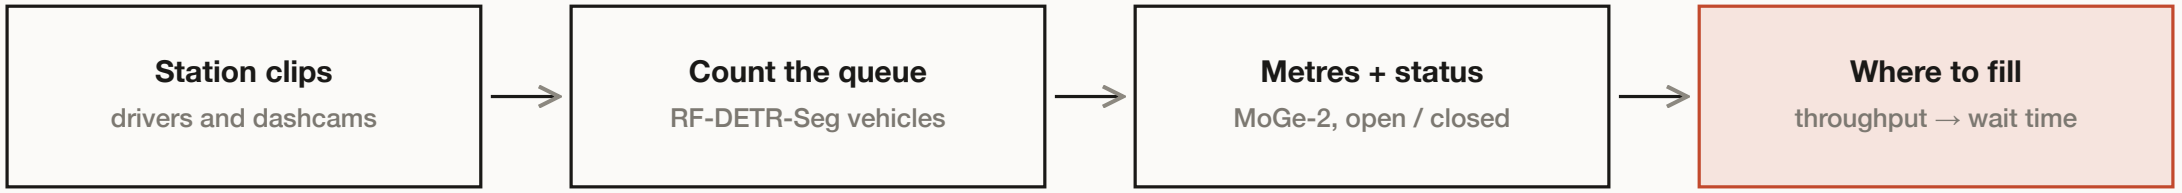

WHO BUYS IT

Taxi and courier fleets; drivers use it.

Navbat

Drivers' station clips become a live methane map: queue length, open or closed, and where to fill now.

HOW IT WORKS

WHY IT MATTERS

On 25 Dec 2025 only 11 of 33 CNG stations serving Tashkent public transport were open. State UGaz has no driver-facing feature; 576k taxi drivers registered in 2024.

HOW PRACTICAL

~400 queue clips from one drive-round of 10–15 stations. Server ~1 s per clip, under $0.001; the phone only captures.

WHO PAYS

Taxi and courier fleets, ~15k UZS per car-month.

JUDGE DEMO

Play a queue video on a laptop: count, status, "go to B".

Moat — per-station hourly throughput priors and winter history · Report score 70/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [24][25][26]

AutodromRef

A phone camera that scores driving-school students like the real exam.

WHAT IT DOES

One phone mounted above the school's practice yard watches the car. AutodromRef tracks the car, the cones and the lines and scores each exercise, such as hill start, parking and the box, the way the exam sensors do. It saves replay clips.

WHY IT MATTERS

The driving exam is scored by sensors and a retake costs 1.2M UZS. Schools are rated on how their students pass, but have no cheap way to practise the exact scoring.

USE CASES

- A student sees exactly where they lost points
- A school runs mock exams without an examiner
- Instructors show replays to explain mistakes

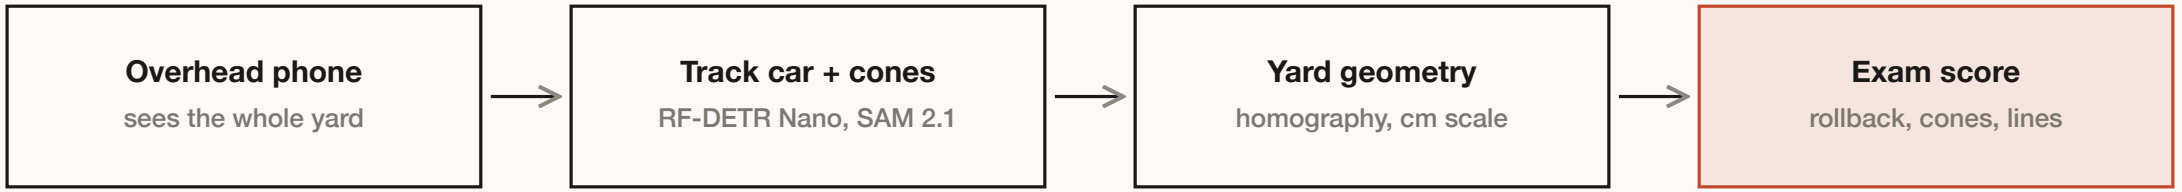

WHO BUYS IT

Driving schools.

AutodromRef

One overhead phone scores a driving school's practice yard on the exam manoeuvres and saves replay clips.

HOW IT WORKS

WHY IT MATTERS

The practical exam is sensor-scored on a 100-point scale with a 1.2M UZS retake; graduates' results carry 30 of 100 school-rating points. No cheap practice tool found.

HOW PRACTICAL

Printed A3 mini-track with toy cars, plus 20 real yard clips. ~15 FPS on CPU/WebGPU; one phone or $60 camera, ~$15/month per track.

WHO PAYS

Driving schools, ~400k UZS per track-camera per month.

JUDGE DEMO

Push a toy car round our printed track: cone hits appear live.

Moat — a replay library calibrated to real exam outcomes · Report score 75/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [4][5][6][7]

MirrorMark

Checks whether a learner driver looks in the mirrors before turning.

WHAT IT DOES

A phone in the car watches the learner's head during a lesson. When the car turns or changes lanes, MirrorMark checks whether the learner looked in the mirror and over the shoulder, and gives feedback after the drive.

WHY IT MATTERS

Missing mirror checks is a classic exam fail and a cause of crashes. Instructors cannot watch the road and the student's eyes at the same time.

USE CASES

- An instructor gets a report of missed checks after each lesson
- A student practises with feedback
- A school tracks progress across lessons

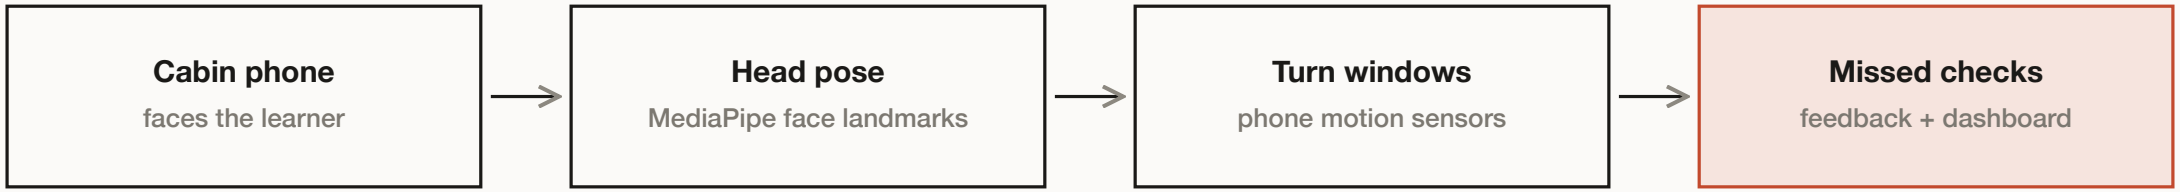

WHO BUYS IT

Driving schools, as an add-on to AutodromRef.

MirrorMark

On-road lesson module for AutodromRef: head pose and gyro score mirror and shoulder checks around turns.

HOW IT WORKS

WHY IT MATTERS

HAMS and Clutch already score mirror checks, so it wins only bundled with yard scoring. The Uzbek exam is sensor-scored, so schools sell measured feedback.

HOW PRACTICAL

60 consented cabin drives with labelled glances. In-browser, 15–30 FPS target, ~zero cost.

WHO PAYS

Driving schools, ~150k UZS per car-month, bundled.

JUDGE DEMO

Watch a route video while the webcam scores your checks.

Moat — learner histories inside the school's CRM · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [4][133][134]

TIER B · 29 IDEAS

Solid B2B niches

Real payers and buildable in a sprint, but smaller markets. Strong modules inside a Tier A platform.

Sotiladi Scout

Finds cars for sale that are never posted online, from "for sale" notes in windows.

WHAT IT DOES

Many sellers just put a "Sotiladi" (for sale) note with a phone number behind the windshield. A dealer walks a market or street with a phone; the app reads each note, identifies the car and ranks a call list by expected profit.

WHY IT MATTERS

These cars never appear on websites, so dealers who find them first get better deals. Today someone walks around writing numbers by hand.

USE CASES

- A dealer finds ten unlisted cars in one market walk
- A trade-in buyer fills stock faster
- A marketplace invites offline sellers online

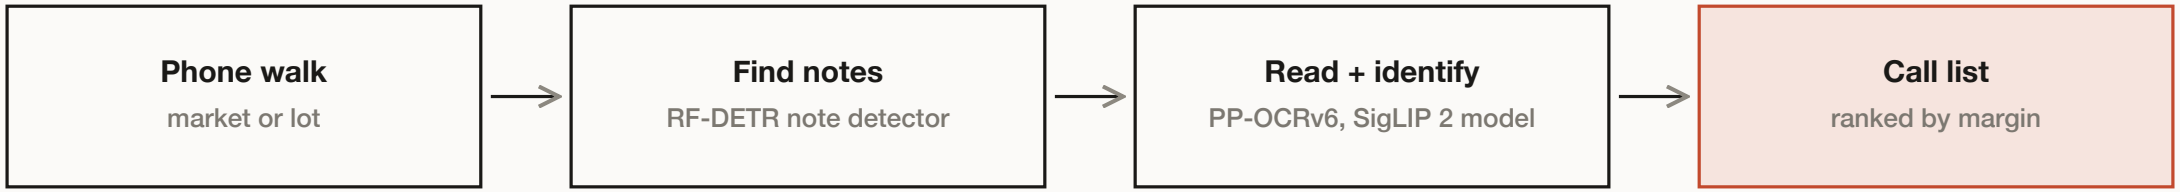

WHO BUYS IT

Used-car dealers and car flippers.

Sotiladi Scout

Walk a car market with a phone: on-device OCR reads for-sale notes behind windshields and ranks a call list by margin.

HOW IT WORKS

WHY IT MATTERS

52–57k used-car deals happen a month, and many sellers never list online. Listing scrapers miss everyone who only puts a note in the window.

HOW PRACTICAL

500 self-collected sign frames plus synthetic notes on car photos. Phone WebGPU; phone numbers stay on-device and database rules apply.

WHO PAYS

Dealers and flippers, ~$30/month or $0.30 per verified lead.

JUDGE DEMO

Point a phone at printed windshield notes: tap-to-call list.

Moat — a map of unlisted supply with call outcomes · Report score 67/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [36][37][38]

Ko'pik

Proves a gas-equipment leak test was really done, from a video of soapy joints.

WHAT IT DOES

After fitting methane or propane equipment, the technician brushes soapy water on every joint and films it. Ko'pik checks every joint was covered, spots bubbles that grow (a leak) and saves a dated record tied to the gas cylinder.

WHY IT MATTERS

Gas leaks in cars can cause fires and explosions. The rules track cylinders but say nothing about proving the leak test, and a third of used-car listings run on gas.

USE CASES

- A conversion workshop proves every car passed a leak test
- An inspection centre reviews tests remotely
- An insurer checks a car's gas safety record

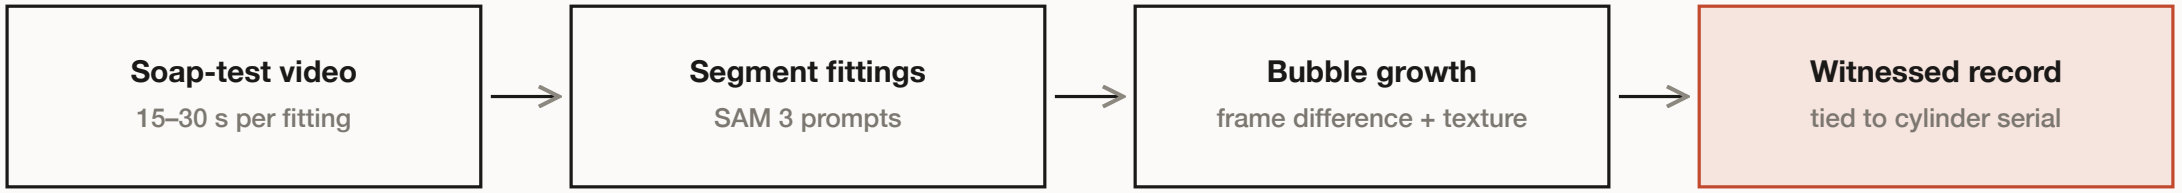

WHO BUYS IT

Gas-conversion workshops and inspection centres.

Ko'pik

Films each soaped gas fitting, proves every joint was covered, spots growing bubbles and files a witnessed leak-test record.

HOW IT WORKS

WHY IT MATTERS

Resolution 315 routes cylinder status into Eco-Himoya and U-Gas but says nothing about leak tests. 33.9% of fuel-typed Avtoelon listings are petrol-gas.

HOW PRACTICAL

100 clips from a borrowed regulator with a syringe-made air micro-leak. Server ~10 fps (estimate), under $0.002 per test.

WHO PAYS

Conversion workshops and inspection centres, ~150k UZS per bay-month.

JUDGE DEMO

Blow through a straw at a plastic fitting: the leak lights up.

Moat — calibrated minimum-detectable-leak data plus workshop histories · Report score 71/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [10][11][12]

BallonID

Reads a gas cylinder's stamped label and says if it is too old or untested.

WHAT IT DOES

Every gas cylinder has numbers stamped into the metal: serial, dates, pressure and gas type. They are hard to read under rust and paint. BallonID takes two photos lit from the side, reads the stamp and applies the official rules: refill, retest or refuse.

WHY IT MATTERS

An out-of-date or wrong cylinder can explode; in Fergana a propane cylinder filled with methane did. Today checks look up the car's plate, not the cylinder itself.

USE CASES

- A filling station checks the cylinder before refuelling
- An inspector reads stamps in seconds
- A car buyer checks a gas-converted car

WHO BUYS IT

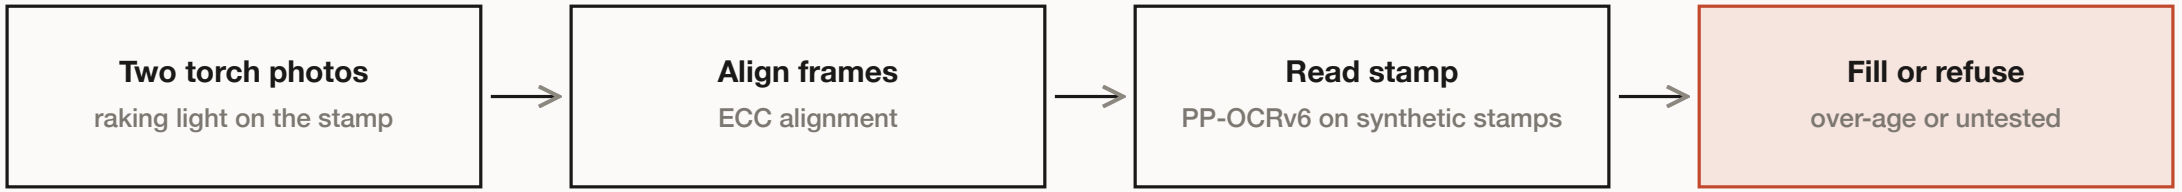

Inspection centres, car inspectors and gas stations.

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [10][79][174]

BallonID

Two raking-light photos of a cylinder stamp read serial, dates, pressure and type, then apply Resolution 315's refuse rules.

HOW IT WORKS

WHY IT MATTERS

UGaz checks by plate, not the physical cylinder. A propane cylinder filled with methane exploded in Fergana.

HOW PRACTICAL

50+ real cylinders, including rust and paint; measured read rate. CPU ~0.5 s, under $0.001.

WHO PAYS

Inspectors and avtopodbor firms, 20k UZS add-on; module for UGaz.

JUDGE DEMO

Torch-photograph our stamped plate: fields read, verdict shown.

Moat — stamp layouts by maker and year · Report score 59/100

GapGauge

Measures the gaps between a car's body panels with a bank card as the ruler.

WHAT IT DOES

You hold any bank card next to the gap between, say, the door and the fender, and take photos. Because every bank card is exactly the same size, GapGauge measures the gap in millimetres and compares the left side of the car with the right.

WHY IT MATTERS

After a crash and repair, panels rarely line up perfectly, so uneven gaps reveal hidden accidents. Inspectors check this by eye today.

USE CASES

- A buyer checks for hidden crash repairs
- An inspector backs up a verdict with numbers
- A trade-in desk prices repaired cars correctly

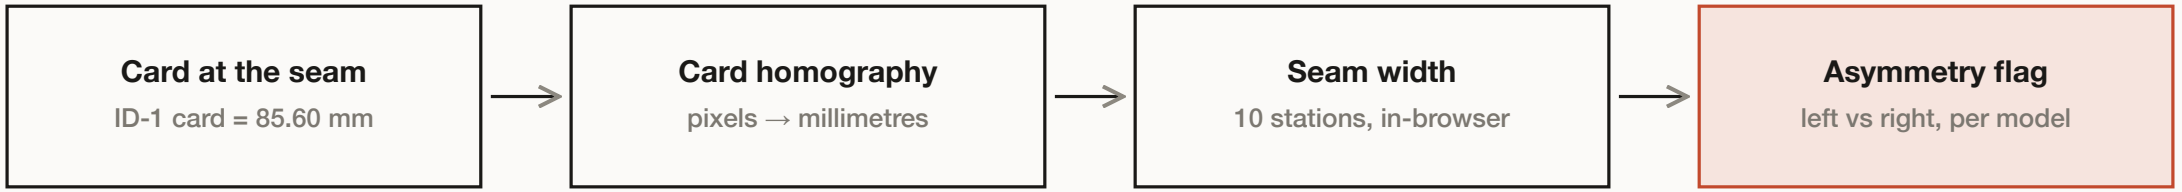

WHO BUYS IT

Car inspection firms and dealers' trade-in desks.

GapGauge

Hold a bank card beside a panel seam: the card gives millimetres, ten stations give taper, left vs right flags repair.

HOW IT WORKS

WHY IT MATTERS

An ID-1 card is 85.60 × 53.98 mm: a ruler everyone carries. Scope's 2019 beta and AI Vahan claim gap checks without a reference object or published accuracy.

HOW PRACTICAL

Feeler-gauge truth on 30 campus cars, 8 seams each. Fully in-browser, under 1 s per seam (to measure), zero server cost.

WHO PAYS

Inspectors and trade-in desks, 10,000 UZS per car or 150k/seat-month.

JUDGE DEMO

Press your card to a car or laptop seam; check it with a ruler.

Moat — feeler-gauge-validated tolerance bands per Chevrolet and BYD model · Report score 64/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [21][22][23]

BoltSeal

Tells whether a car panel was ever removed, from close-up photos of its bolts.

WHAT IT DOES

At the factory, the bolts holding doors, hood and fenders are painted over. If a panel was removed for repair, a wrench leaves marks and cracks the paint. BoltSeal checks close-up photos of each bolt and flags the ones that were turned.

WHY IT MATTERS

It is a well-known trick of professional inspectors, but it needs expertise. Automating it gives any buyer or bank a quick hidden-repair check.

USE CASES

- A bank checks a car before lending on it
- A trade-in desk spots a replaced fender
- A buyer checks a car before a full inspection

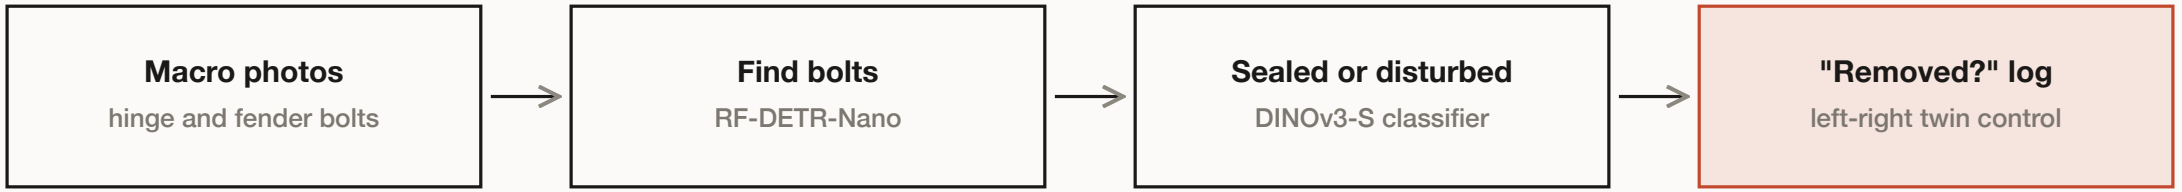

WHO BUYS IT

Dealers' trade-in desks, auto lenders and inspectors.

BoltSeal

Guided macro photos of hinge and fender bolts flag wrench marks and cracked paint seals: was this panel removed?

HOW IT WORKS

WHY IT MATTERS

Bolt checks are a manual inspector trick and no fastener-level AI was found. Avtopodbor starts at 300,000 UZS; this costs a fraction.

HOW PRACTICAL

Controlled before/after wrench test on scrap panels of 2 models. ONNX in browser with a server fallback (2.3 ms on a T4).

WHO PAYS

Trade-in desks and lenders, ~15,000 UZS per car.

JUDGE DEMO

Scan six bolts on our board; three were secretly wrenched.

Moat — per-model maps of bolts factories adjust legitimately · Report score 63/100

Proof-of-Inspection

Checks the inspector's work, not the car, so banks can trust inspection reports.

WHAT IT DOES

When a car inspector films an inspection, this app checks that all required steps were done: VIN read, odometer shown, paint gauge used. It also catches reused videos and VINs that don't match the documents.

WHY IT MATTERS

Banks and marketplaces rely on inspection PDFs that nobody verifies. A lazy or dishonest inspector can approve a bad car.

USE CASES

- A bank accepts only verified inspections for car loans
- A marketplace labels trustworthy inspection reports
- An inspection firm proves its quality

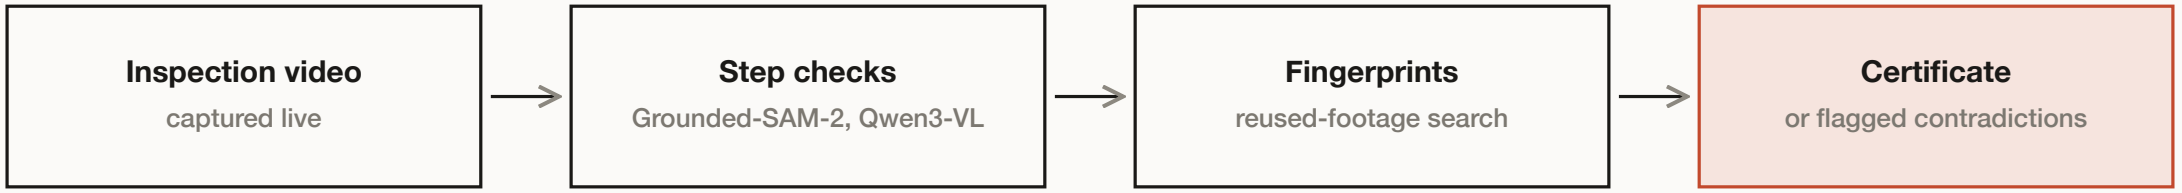

WHO BUYS IT

Banks, leasing firms and car marketplaces.

Proof-of-Inspection

Audits the inspector, not the car: checks live inspection video for required steps, reused footage and VIN contradictions.

HOW IT WORKS

WHY IT MATTERS

Banks, lessors and marketplaces rely on inspection PDFs nobody verifies. Inspektlabs checks its own capturer's media; third-party inspectors go unaudited.

HOW PRACTICAL

Scripted staged inspections with deliberate omissions. Server ~40 s, under $0.05 per audit.

WHO PAYS

Banks, leasing firms and marketplaces, 10,000 UZS per audit.

JUDGE DEMO

Film a toy-car walk-around, type "no damage", get challenged.

Moat — an inspector reputation graph · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [42]

Lowside

Shows whether a used moped or motorcycle has been crashed, from photos.

WHAT IT DOES

When a bike falls, it scrapes the same places: levers, foot pegs, mirrors, engine covers. Lowside finds these points in photos, tells crash scrapes from normal wear, and draws a simple damage map.

WHY IT MATTERS

Courier fleets buy and rent out many used mopeds, and hidden crash damage makes them unsafe and costly. There were 563 moped and scooter crashes in nine months of 2026.

USE CASES

- A courier fleet checks mopeds at hand-over and return
- A lessor documents damage fairly
- A buyer avoids a crashed bike

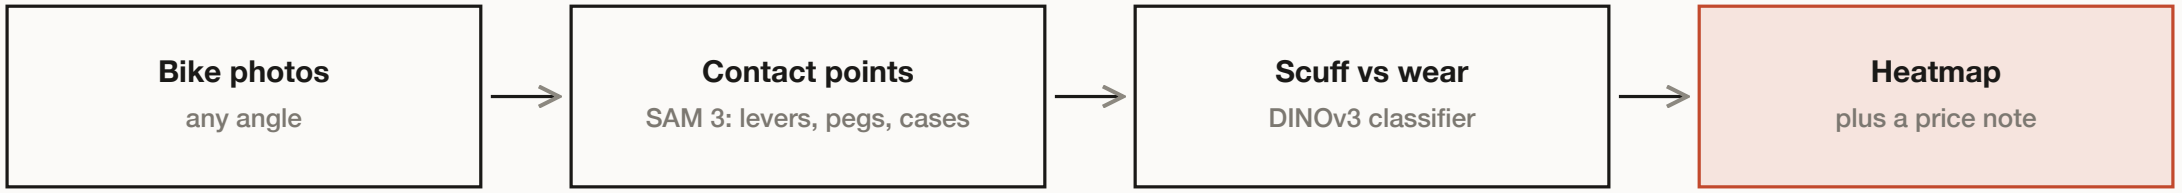

WHO BUYS IT

Moped leasing firms and courier fleets.

Lowside

Zone-by-zone scuff map for used mopeds and motorcycles plus fork symmetry: crash history at check-in and check-out.

HOW IT WORKS

WHY IT MATTERS

563 moped and scooter crashes in Jan–Sep 2026. Motoryk sells a $4.99 one-off report; fleets need a repeatable check-in loop.

HOW PRACTICAL

Weakly labelled OLX photos; ~30 mechanic-inspected bikes for a hit rate. Server L4 ~0.8 s, ~$0.002.

WHO PAYS

Moped lessors and courier fleets, ~$2 per check.

JUDGE DEMO

Upload any bike photo: scuff heatmap.

Moat — two-wheeler crash-signature labels · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [16][43]

LemonBack

A money-back guarantee for used cars, priced from a 10-minute photo check.

WHAT IT DOES

The seller records a guided 10-minute video of the car. Checks for hidden repairs, mileage and damage price the risk. If the buyer later finds a problem the video should have shown, an insurer buys the car back within 30 days.

WHY IT MATTERS

Buyers fear hidden problems, which pushes prices down for honest sellers. A guarantee builds trust, and insurers need new products.

USE CASES

- An honest seller sells faster with a guarantee
- A buyer gets their money back if the car hid a repair
- An insurer gains a new product line

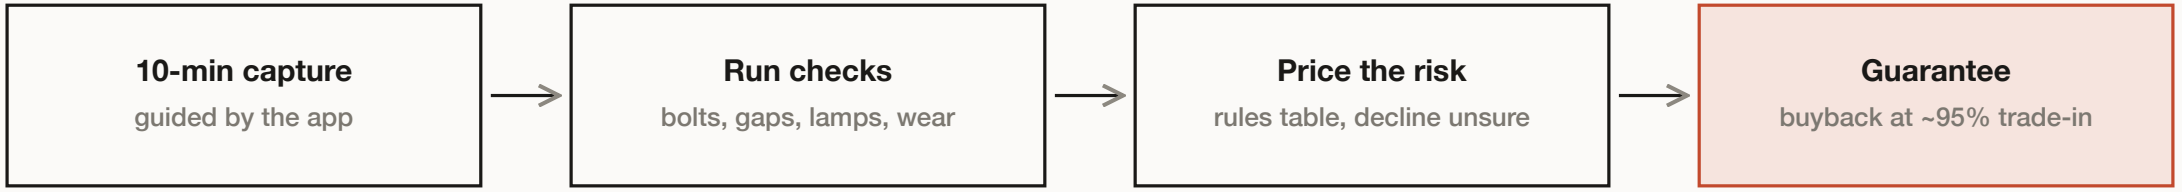

WHO BUYS IT

Private sellers pay; an insurer carries the risk.

LemonBack

A seller-paid, insurer-backed 30-day buyback guarantee covering only what a dated 10-minute capture proves.

HOW IT WORKS

WHY IT MATTERS

KASKO premiums fell 47% in 2025, so insurers need new products. Earlier buyback guarantees (2009, Carro) were not priced from photos.

HOW PRACTICAL

40 captured cars with inspector verdicts; a break-even claim-rate table. Server ~3 s, ~$0.01 per car.

WHO PAYS

Private sellers ~300,000 UZS; the insurer carries risk, we take commission.

JUDGE DEMO

Live capture; toggle a defect and watch the premium move.

Moat — loss data from issued guarantees · Report score 52/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [33][66][67]

Drip-ID

Tells which fluid a car is leaking, using a printed card and two photos.

WHAT IT DOES

Put the card under the car's engine and take two photos ten minutes apart. Water from the air-conditioner evaporates; oil, gearbox fluid and coolant stay and have typical colours. Drip-ID names the fluid and how serious it is.

WHY IT MATTERS

A leak can mean a cheap fix or a big repair. Most buyers cannot tell, and standard inspections often skip it.

USE CASES

- A buyer checks a used car for leaks
- An inspector adds a leak test to the report
- A driver knows whether to visit a garage

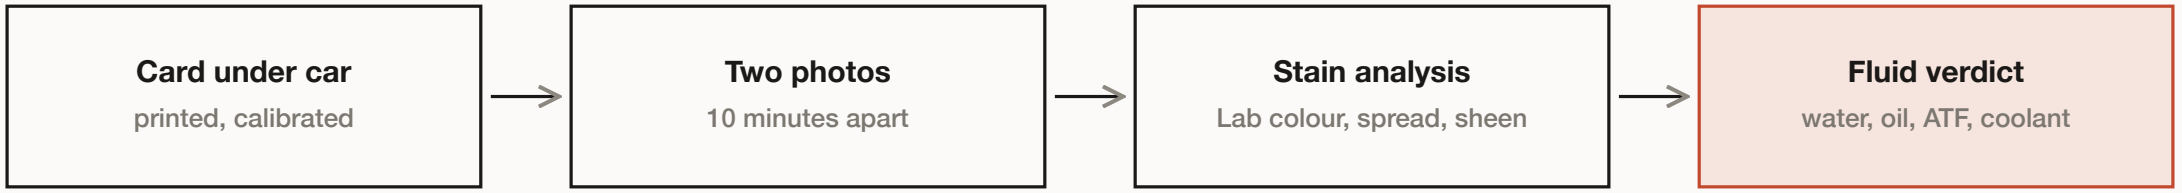

WHO BUYS IT

Car inspectors and used-car buyers.

Drip-ID

Used-car drip test: a printed card under the car and two photos ten minutes apart identify the fluid that is leaking.

HOW IT WORKS

WHY IT MATTERS

A Tashkent avtopodbor from 300,000 UZS lists no leak check. Fleet photo tools exist, but no consumer drip card was found.

HOW PRACTICAL

Pour 6 fluids on cardboard, asphalt and tile in sun, shade and night: ~800 photos. Browser mask, under 2 s, below $0.001.

WHO PAYS

Inspectors and buyers, $1–2 per report plus card consumables.

JUDGE DEMO

Drip water or tea on our card: fluid class and verdict.

Moat — an aged-leak library per local engine · Report score 66/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [34][35]

Razborka Lens

Recognises used car parts from a photo and writes the sale listing.

WHAT IT DOES

Car breakers (razborka) sell thousands of used parts, many without part numbers. Razborka Lens recognises a bumper, lamp or mirror from its shape, finds which cars it fits, and drafts an Uzbek and Russian ad with a fair price.

WHY IT MATTERS

Listing parts by hand is slow, so most stock never gets listed. Buyers struggle to know if a part fits their car.

USE CASES

- A breaker lists 100 parts a day instead of 10
- A buyer sees which models a part fits
- A parts shop prices stock fairly

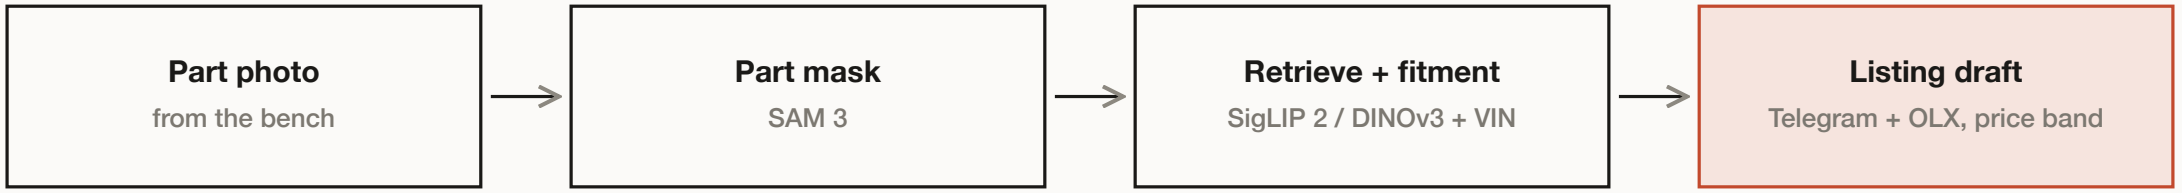

WHO BUYS IT

Car breakers and used-parts sellers.

Razborka Lens

Identifies number-less used parts by shape plus donor VIN, then drafts Uzbek and Russian listings with a fair-price band.

HOW IT WORKS

WHY IT MATTERS

OLX lists 67,363 parts ads. Robzar reads part numbers, but bumpers, lamps and door cards have none.

HOW PRACTICAL

10–15 real donor teardowns plus OLX parts photos. Server L4 ~1 s, ~$0.002 per part.

WHO PAYS

Dismantlers and parts sellers, ~$25/month or per API call.

JUDGE DEMO

Photograph a part from our bench: listing drafted.

Moat — a fitment graph for local Chevrolet and Chinese platforms · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [46][72]

Brake Peek

Checks brake-pad thickness during a tyre change, with one photo.

WHAT IT DOES

When the wheel is off for a tyre change, the brake pads are visible. The mechanic takes one photo with a small marker card. Brake Peek measures the pad thickness and sends the customer a Telegram card: fine, soon, or replace now.

WHY IT MATTERS

Worn brakes are dangerous, and customers rarely believe a mechanic's word. A measured photo builds trust and sells a needed repair.

USE CASES

- A tyre shop offers a brake check with every tyre change
- A driver sees proof their pads are worn
- A fleet tracks brake wear across cars

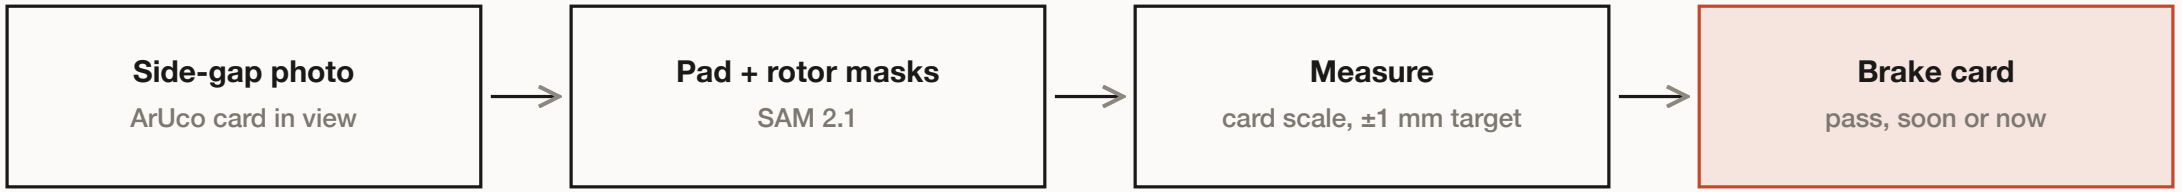

WHO BUYS IT

Tyre shops and service centres.

Brake Peek

While the wheel is off for a tyre swap, one photo with a marker card measures brake-pad thickness and sends a quote.

HOW IT WORKS

WHY IT MATTERS

Chevrolet took 83% of Jan–Sep 2025 new sales, so two caliper families cover most cars. Always prints "inner pad unchecked".

HOW PRACTICAL

30+ caliper-measured pads across two Chevrolet caliper families. In-browser ~1.5 s, ~zero cost.

WHO PAYS

Tyre shops, ~$20/month; every swap becomes a brake upsell.

JUDGE DEMO

Photograph our mounted junkyard pad sets.

Moat — wear-by-mileage data; claim the guided capture (Nissan holds a US pad patent) · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [73][74]

TremorLab

Measures a car engine's shaking from a phone video to check its engine mounts.

WHAT IT DOES

Two small printed tags are stuck on the engine and the body. A phone films while someone revs the engine. TremorLab measures how far the engine rocks in millimetres and compares it with a healthy engine of the same model.

WHY IT MATTERS

Worn engine mounts cause vibration and damage, but mechanics judge them by feel. A measured number makes the diagnosis clear.

USE CASES

- A garage shows a customer why the mounts need replacing
- A taxi park checks engines regularly
- A buyer checks a used car's engine

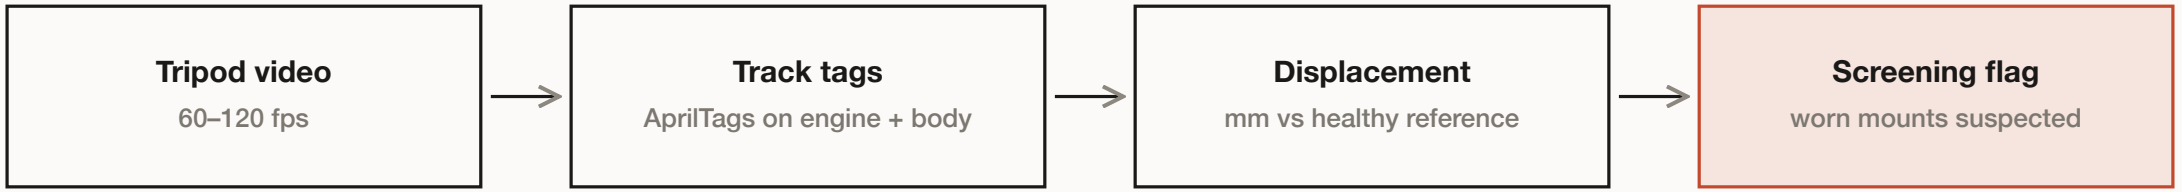

WHO BUYS IT

Garages and taxi-park workshops.

TremorLab

Engine-rock screening: a tripod phone films two printed tags during throttle blips and measures the rock in millimetres.

HOW IT WORKS

WHY IT MATTERS

KCF's phone vibration app is industrial-only; nobody screens car engines this way. 33.9% of listings are petrol-gas, so idle on both fuels can be compared.

HOW PRACTICAL

Friends' Nexia, Cobalt and Gentra plus synthetic sub-pixel motion. Modal L4, ~$0.002 per scan.

WHO PAYS

Garages and taxi-park workshops, 10,000 UZS per scan.

JUDGE DEMO

Film a buzzing phone or your own bonnet: rock in mm.

Moat — vibration signatures per Chevrolet engine · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [11][75]

Orange Guard

Scores mechanics' safety drill before they work on high-voltage electric cars.

WHAT IT DOES

Before touching an electric car's high-voltage system, a mechanic must follow strict steps: gloves, warning cones, lock and tag, in the right order. Orange Guard watches the drill on camera and scores each step against the manufacturer's checklist.

WHY IT MATTERS

Mistakes with EV high voltage can kill. Many service bays are new to EVs, and training needs a record. A person still checks the voltage.

USE CASES

- A dealer trains new EV technicians
- A training college grades practical exams
- A service centre keeps safety records

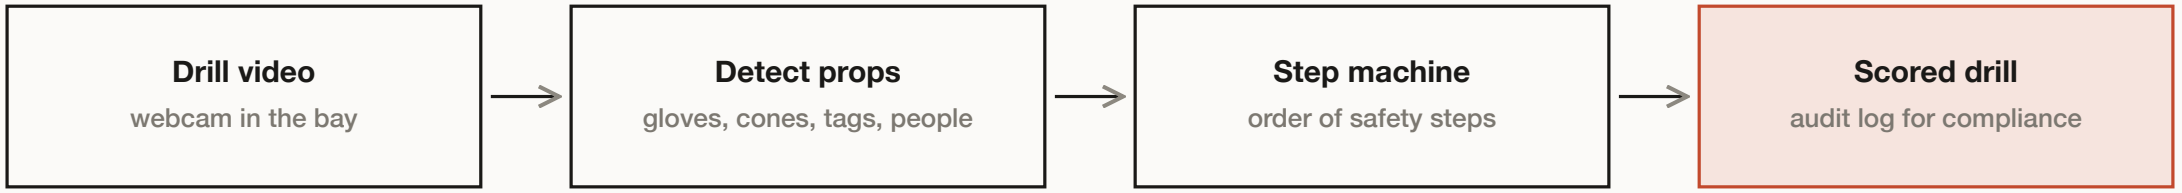

WHO BUYS IT

EV service academies, dealers and vocational colleges.

Orange Guard

Scores an EV technician's high-voltage lockout drill against the OEM checklist; a human still verifies zero voltage.

HOW IT WORKS

WHY IT MATTERS

122.7k EVs are on the road and many service bays are new to high voltage. Generic PPE vision exists; EV lockout drills go unscored.

HOW PRACTICAL

40 staged routines with right and wrong variants. Runs in the browser.

WHO PAYS

BYD/Royal Motors academies, colleges, dealers, ~$25 per bay-month.

JUDGE DEMO

Play mechanic with props: green only after all steps.

Moat — an OEM-endorsed checklist · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [13][76][77]

FakeStop

Spots fake car parts from photos of their box and label.

WHAT IT DOES

Genuine filters, brake pads and spark plugs have fine print and hologram details that fakes copy badly. FakeStop compares close-up photos of the box with genuine samples and says: genuine, suspect, or unknown product.

WHY IT MATTERS

Fake parts are common at bazaars and can fail dangerously, like brakes. A third of Russian repair shops met fakes in 2025.

USE CASES

- A mechanic checks parts before fitting them
- A brand owner maps where fakes are sold
- A buyer checks a box at the bazaar

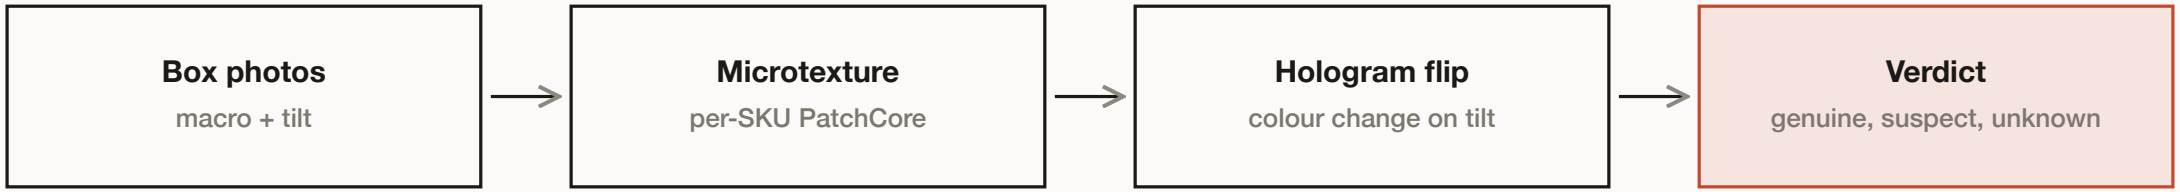

WHO BUYS IT

Car-parts brand owners and official importers.

FakeStop

Counterfeit scanner for one genuine-parts family: print microtexture and hologram tilt say genuine or suspect.

HOW IT WORKS

WHY IT MATTERS

32% of Russian repair shops met fake parts in 2025. Authentic Vision needs its own labels; this retrofits existing packaging. Unknown SKUs are refused.

HOW PRACTICAL

10 genuine boxes per SKU; 20+ brand-confirmed bazaar suspects. In-browser ~0.5 s per patch.

WHO PAYS

Brand owner or importer, $300–800/month plus a hotspot dashboard.

JUDGE DEMO

Scan six boxes: which are fake?

Moat — a genuine reference library per SKU · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [80][81]

Claim Pack

Catches fake or reused photos in dealers' warranty repair claims.

WHAT IT DOES

When dealers ask the importer to pay for warranty repairs, they send photos of the VIN, odometer and parts. Claim Pack searches all dealers' photos and flags pictures used twice, odometers that go backwards, or parts that don't match.

WHY IT MATTERS

Each claim is reviewed alone, so a photo reused across dealers goes unseen. The importer pays for repairs that never happened.

USE CASES

- An importer audits all dealers' warranty claims
- A carmaker spots a dealer with suspicious claims
- Honest dealers get paid faster

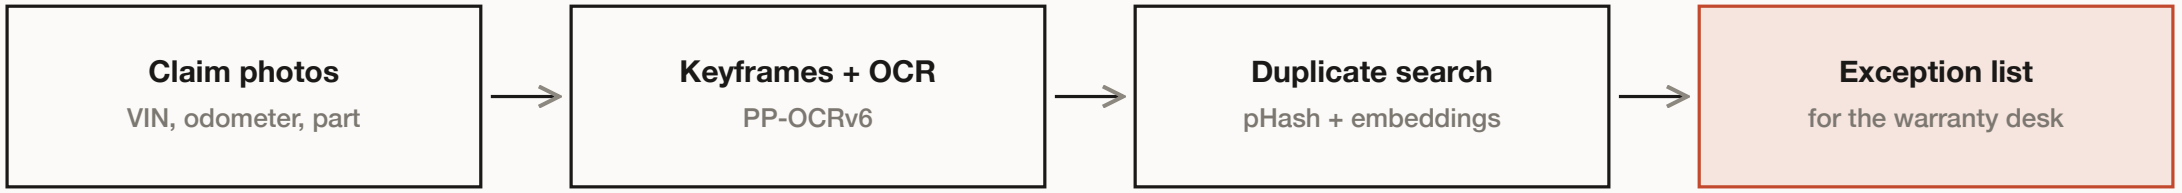

WHO BUYS IT

Car importers and carmakers' warranty departments.

Claim Pack

Cross-dealer warranty auditor: flags reused, inflated or out-of-sequence claim photos across every dealer.

HOW IT WORKS

WHY IT MATTERS

Each dealer's claims are reviewed separately, so a photo reused across dealers goes unseen. GM's dealer app sees one dealer; the importer view is missing.

HOW PRACTICAL

30 mock repairs with duplicate traps. Browser OCR, server dedup, ~$0.01 per claim.

WHO PAYS

Royal Motors and UzAuto Motors warranty desks, $0.50 per claim.

JUDGE DEMO

Film a screen showing a VIN plate and odometer.

Moat — a cross-dealer duplicate graph · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [84][85]

Spot-Oil

Tells whether engine oil needs changing, from one drop on a paper card.

WHAT IT DOES

The mechanic puts a drop of engine oil on a printed card. The oil spreads into rings; their colour and shape show how dirty or contaminated it is. Spot-Oil reads a photo of the card and says: change now, or suspected contamination.

WHY IT MATTERS

Fleets change oil by the calendar, often too early or too late. Gas-powered taxis wear oil differently from petrol cars.

USE CASES

- A taxi fleet changes oil only when needed
- A mechanic spots coolant in the oil early
- A fleet tracks engine health over time

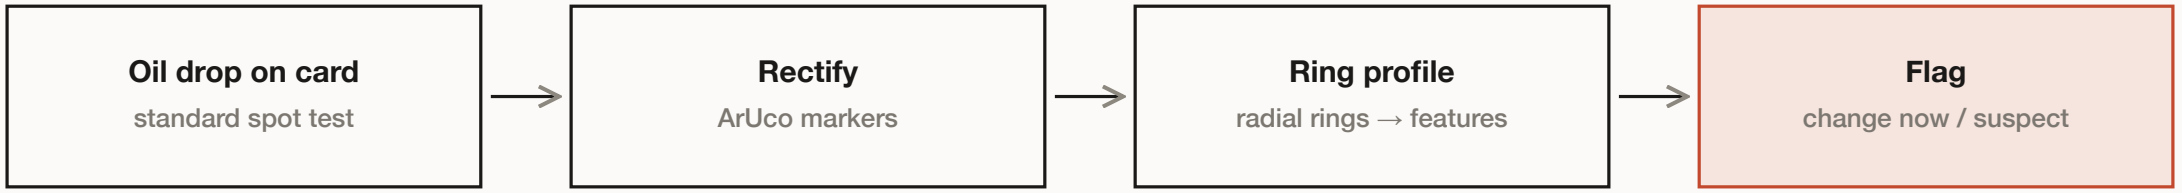

WHO BUYS IT

Taxi parks and delivery fleets.

Spot-Oil

A printed blotter card plus a phone photo triages used engine oil: change now, or contamination suspected.

HOW IT WORKS

WHY IT MATTERS

The ASTM D7899 spot test is read by eye and no phone product was found. 33.9% of fuel-typed listings are petrol-gas, where oil ages differently.

HOW PRACTICAL

≥30 lab-analysed samples from CNG/LPG taxis for an ROC curve. In-browser under 1 s; the card costs ~$0.02.

WHO PAYS

Taxi parks and delivery fleets, $0.15 per card plus trend dashboard.

JUDGE DEMO

Photograph our pre-dried cards: verdicts.

Moat — a fleet-outcome spot library; the card is a consumable · Report score 67/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [11][92]

Plomba Twin

Proves a fuel tanker's seal was not swapped during the trip.

WHAT IT DOES

Fuel tankers are sealed at the depot. Plomba Twin photographs the seal at the start and at every stop and checks it is the same physical seal, not a lookalike with the same number.

WHY IT MATTERS

Fuel can be stolen by opening a tank and fitting a new seal with the same serial. A serial-number check alone does not catch it.

USE CASES

- A fuel company checks seals at each delivery
- A cargo insurer requires seal photos
- A forwarder proves a trip was clean

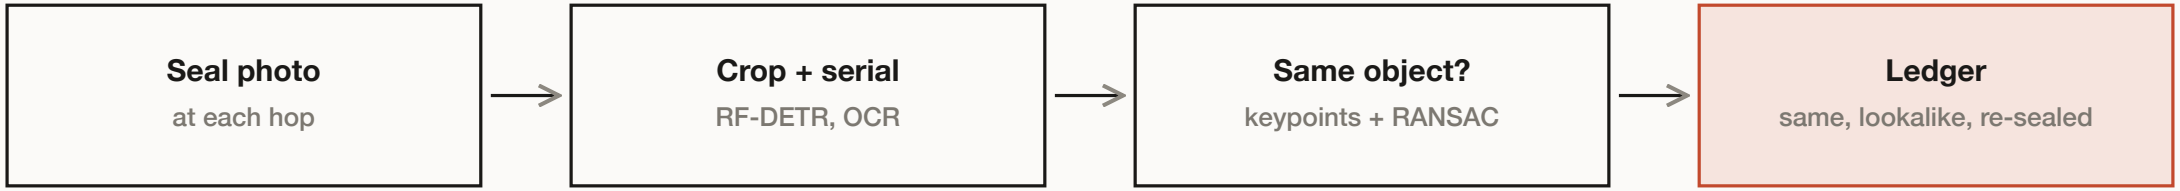

WHO BUYS IT

Fuel-tanker operators, forwarders and cargo insurers.

Plomba Twin

Seal evidence ledger for fuel tankers: proves the seal at arrival is the same physical seal fitted at the depot.

HOW IT WORKS

WHY IT MATTERS

A same-serial lookalike passes a serial check. Alitheon fingerprints objects generically; EAEU GPS e-seals cover regulated transit, not domestic fuel legs.

HOW PRACTICAL

40 bought seals × 12 photos, including same-serial lookalikes; published ROC. On-device or server ~0.3 s.

WHO PAYS

Tanker operators, forwarders, cargo insurers, $0.30 per seal.

JUDGE DEMO

Photograph a seal; we swap in a lookalike: caught.

Moat — a ledger that spans every hop · Report score 64/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [93][94]

CubeProof

Measures the volume of sand or gravel in a truck from one photo.

WHAT IT DOES

Before the truck leaves the quarry, one photo is taken from above. CubeProof measures the load's volume and weight and flags short loads, so the buyer knows they got what they paid for.

WHY IT MATTERS

Buyers of building materials often receive less than they paid for; one quarry pilot found 2-3% under-delivery. Laser scanners are expensive; a phone photo is not.

USE CASES

- A builder checks every delivered load
- A trader proves full loads to customers
- A city checks contractors' deliveries

WHO BUYS IT

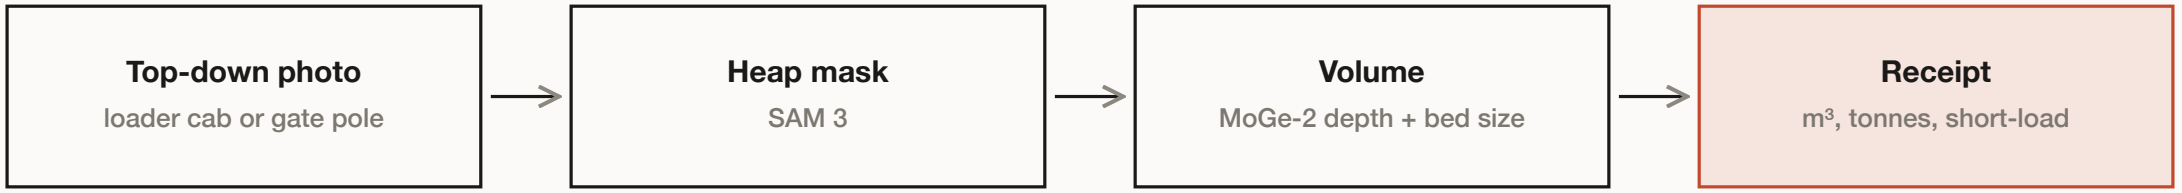

Construction companies, material traders and municipal contractors.

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [95][96][97]

CubeProof

Buyer-side receipt for bulk loads: a top-down shot returns cubic metres, tonnes and a short-load flag before tarping.

HOW IT WORKS

WHY IT MATTERS

A quarry pilot found 2–3% under-delivery. LOADSCAN uses 700+ laser scanners; this needs only a phone, validated against weighbridge tickets.

HOW PRACTICAL

60 real loads vs weighbridge tickets. Server T4 ~1.5 s, ~$0.0003.

WHO PAYS

Developers, material traders, municipal contractors, $0.10 per load.

JUDGE DEMO

Photograph our rice box beside a marker: volume.

Moat — ticket-photo calibration per material · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [95][96][97]

QueueLedger

Tells truck drivers how long the border queue will take, from one photo.

WHAT IT DOES

Someone near the border photographs the truck queue. QueueLedger counts the trucks, measures the line's length and, with the crossing's usual speed, estimates how many hours the wait will be. Results go to a Telegram bot.

WHY IT MATTERS

At some crossings 400+ trucks get stuck and waits pass 24 hours. Without an official e-queue, forwarders plan blind.

USE CASES

- A forwarder picks the faster border crossing
- A driver plans rest around the wait
- A logistics firm warns its customer of delays

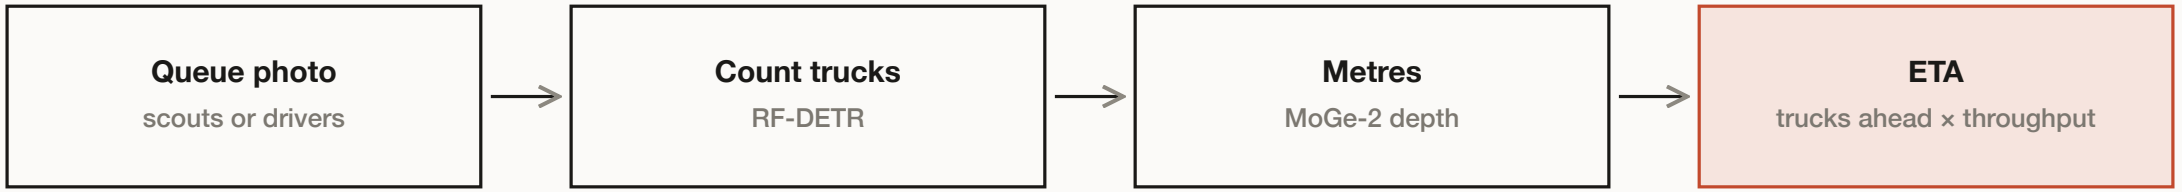

WHO BUYS IT

Freight forwarders on Central Asian corridors.

QueueLedger

A single photo of a border queue gives trucks-ahead and an ETA in a Telegram bot.

HOW IT WORKS

WHY IT MATTERS

400+ trucks were stuck at Tazhen and Gisht-Kuprik waits exceed 24 hours. Belarus queue apps run on official e-queues; here none exists.

HOW PRACTICAL

Scout photos plus Central Asia plates. Server T4 ~0.5 s per photo; benchmark against a GPS-only ETA.

WHO PAYS

Corridor forwarders, ~$3 per truck-crossing.

JUDGE DEMO

Photograph a toy-truck queue: trucks ahead and ETA.

Moat — per-crossing throughput history · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [102][103][104]

Cargo-Fit

Picks the right delivery vehicle and price from a photo of what you want to move.

WHAT IT DOES

A customer photographs the items, such as a sofa, fridge or boxes. Cargo-Fit measures them, works out what fits, and suggests a Damas, Labo or bigger truck with the right number of loaders and a price.

WHY IT MATTERS

Dispatchers guess the vehicle size, so trucks arrive too small or too big. Wrong vehicles waste time and money.

USE CASES

- A moving app quotes instantly from photos
- A cargo-taxi dispatcher sends the right van
- A customer compares prices before booking

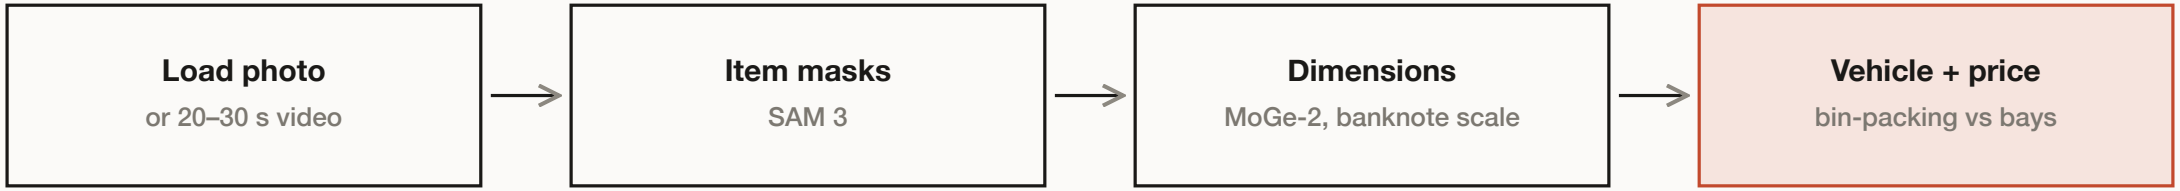

WHO BUYS IT

Cargo-taxi and moving platforms.

Cargo-Fit

Suggests a Damas, Labo or Gazelle plus loaders from photos of the load, priced instantly.

HOW IT WORKS

WHY IT MATTERS

Damas and Labo were ~35% of Jan–Sep 2025 sales, and dispatchers guess vehicle size. Fraunhofer CargoSight measures truck fill, not vehicle choice.

HOW PRACTICAL

300 measured household items; ~30 real jobs vs a human dispatcher. Server ~2 s, ~$0.003.

WHO PAYS

Dispatch and marketplace platforms, ~$0.01 per quote.

JUDGE DEMO

Photograph a chair beside a banknote: vehicle and price.

Moat — dispatch outcome data · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [73][111]

ScaleGuard

Catches cheating at truck weighbridges using the camera already there.

WHAT IT DOES

At a weighbridge, trucks are weighed full and empty. ScaleGuard watches the existing camera and flags tricks: a wheel off the scale, a person on the platform, or a different truck at the second weighing.

WHY IT MATTERS

Cheating at the scale costs grain, cotton and cement buyers real money on every load. It needs no new hardware.

USE CASES

- A grain buyer stops paying for fake weight
- A cement plant audits its scale
- A cotton gin proves fair weighing to farmers

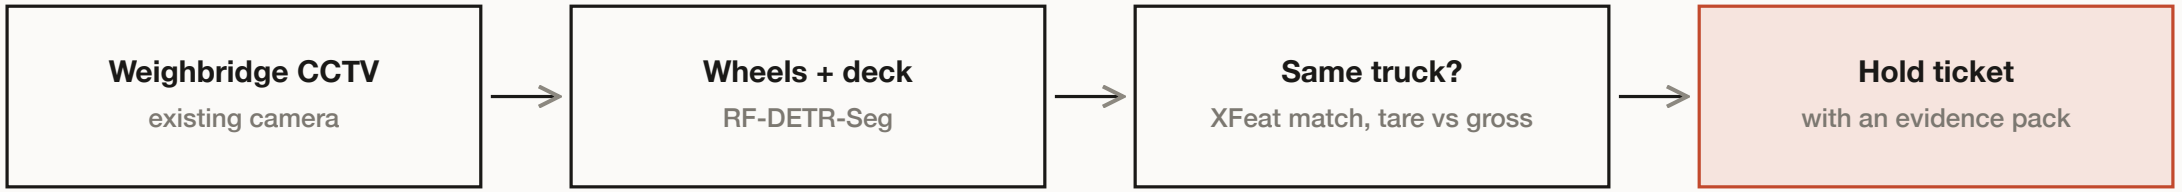

WHO BUYS IT

Grain and cotton buyers and cement plants.

ScaleGuard

Software retrofit on weighbridge CCTV: flags a wheel off the platform, extra people or a tare-vs-gross truck swap.

HOW IT WORKS

WHY IT MATTERS

Chinese unmanned-weighbridge vendors advertise these detections; no Central Asian retrofit was found. A lifted-axle CNN reached 87% precision.

HOW PRACTICAL

Get real weighbridge footage before pitching; toy rig for the demo. Server; edge-board support unverified.

WHO PAYS

Grain and cotton buyers, cement receivers, ~$80 per scale-month.

JUDGE DEMO

Try to cheat our toy weighbridge.

Moat — site-level fraud patterns · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [113][114]

Hakam

Checks electric-car charging bills against what the car actually received.

WHAT IT DOES

The driver photographs the charger's screen and the car's "energy added" screen. Hakam compares the two numbers to catch charging someone else's car on the company card, or a charger that overbills.

WHY IT MATTERS

Fleets pay for charging on cards that are easy to misuse. One UK review found 31.5% of chargers out of tolerance.

USE CASES

- An EV taxi fleet catches card misuse
- A fleet ranks chargers that overbill
- A charger operator proves its meters are accurate

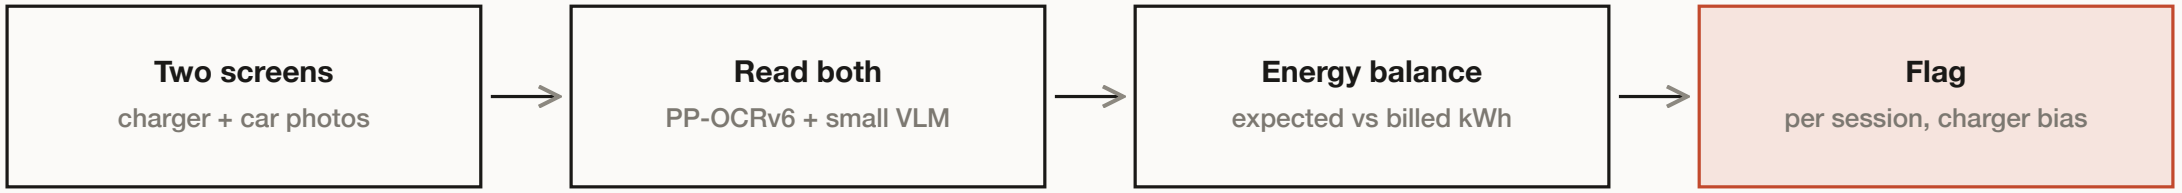

WHO BUYS IT

EV fleets and charging operators.

Hakam

Fleet-card audit for EV fleets: billed kWh vs the car's own "energy added" screen catches charging someone else's car.

HOW IT WORKS

WHY IT MATTERS

31.5% of reviewed UK chargers were out of tolerance. WEX uses telematics; mandatory metrological checks are planned here.

HOW PRACTICAL

3–5 real sessions against a wall meter. Server CPU ~0.3 s per photo.

WHO PAYS

EV fleets and charge-point operators, ~20k UZS per car-month.

JUDGE DEMO

Pick a session pair: expected vs billed kWh.

Moat — crowd-sourced charger-bias scores · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [115][116][117]

Yield-to-Win

Rewards drivers who stop for pedestrians, instead of only fining those who don't.

WHAT IT DOES

Drivers sign up with their plate number. A camera at a crossing sees a driver stop for waiting pedestrians and enters them into a prize draw funded by a bank's loyalty budget.

WHY IT MATTERS

Pedestrians are involved in about 46% of crashes. Rewards can change habits where fines alone do not, and a sponsor gets positive publicity.

USE CASES

- A bank runs a road-safety loyalty campaign
- A city rewards safe drivers at school crossings
- A driver earns cashback for stopping

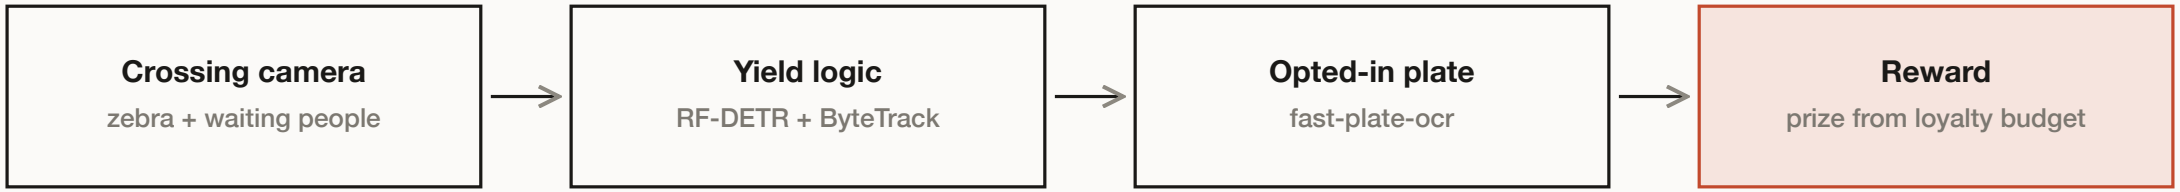

WHO BUYS IT

Bank sponsors (such as Uzcard or MKBANK) with a city pilot.

Yield-to-Win

Rewards instead of fines: crossing cameras confirm opted-in drivers who stop for pedestrians and pay lottery-style prizes.

HOW IT WORKS

WHY IT MATTERS

Pedestrians were in ~46% of crashes. AI cameras issued ~1,700 fines in 3 days at 10 crossings (blogger-reported); this flips punishment to reward.

HOW PRACTICAL

3 filmed Tashkent crossings, 200 labelled yields, synthetic Uzbek plates. ~$500 edge box or server.

WHO PAYS

A bank sponsor (Uzcard, MKBANK) plus a city pilot, ~3M UZS per crossing-month.

JUDGE DEMO

Register a toy plate; a crossing clip triggers the reward.

Moat — an opt-in user base and A/B safety evidence · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [123][124]

Dispatch Card

Turns a crash video into a quick summary card for emergency and assistance services.

WHAT IT DOES

A bystander or dashcam sends a short crash video. Dispatch Card writes a short card in Uzbek or Russian: how many vehicles and people, any fire or smoke, and whether a gas cylinder may be involved.

WHY IT MATTERS

Responders often arrive without knowing what they will find. Gas-powered cars add a fire and explosion risk they should know about.

USE CASES

- A roadside-assistance desk sends the right help
- An insurer gets a first report within seconds
- Responders know about gas risk early

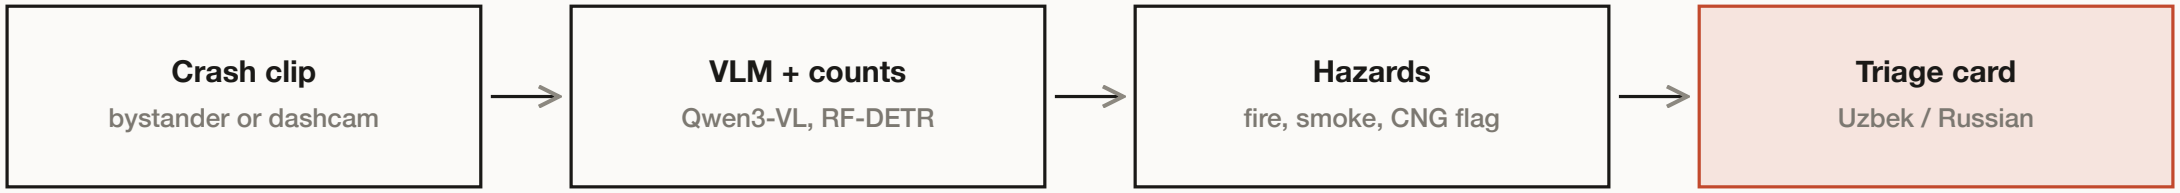

WHO BUYS IT

Roadside-assistance companies and insurers' claim desks.

Dispatch Card

A bystander or dashcam crash clip becomes an Uzbek/Russian triage card: vehicles, people, fire, smoke, CNG risk.

HOW IT WORKS

WHY IT MATTERS

Uzbek cylinder blasts happen while refuelling, so responders need to know the gas risk. 911 live-video tools send video without analysis.

HOW PRACTICAL

DoTA, CCD, DAD, UCF-Crime; report recall and precision. L4 ~6 s per 10 s clip, ~$0.002.

WHO PAYS

Roadside-assistance and insurer desks, per seat.

JUDGE DEMO

Play a crash clip: the card arrives ~8 s later.

Moat — a CNG/LPG hazard library · Report score 63/100

SeatProof

Checks from photos that a child car seat is installed correctly.

WHAT IT DOES

A parent photographs the installed child seat. SeatProof checks common mistakes: wrong seat for the child's age, wrong direction, twisted straps, chest clip too low. It marks errors on the photo and always reminds you to check tightness by hand.

WHY IT MATTERS

Badly installed seats protect children much less. A new draft rule proposes fines, and most parents never get a check.

USE CASES

- A shop checks the installation when a parent buys a seat
- A parent checks before a long drive
- A taxi company shows its child seats are installed well

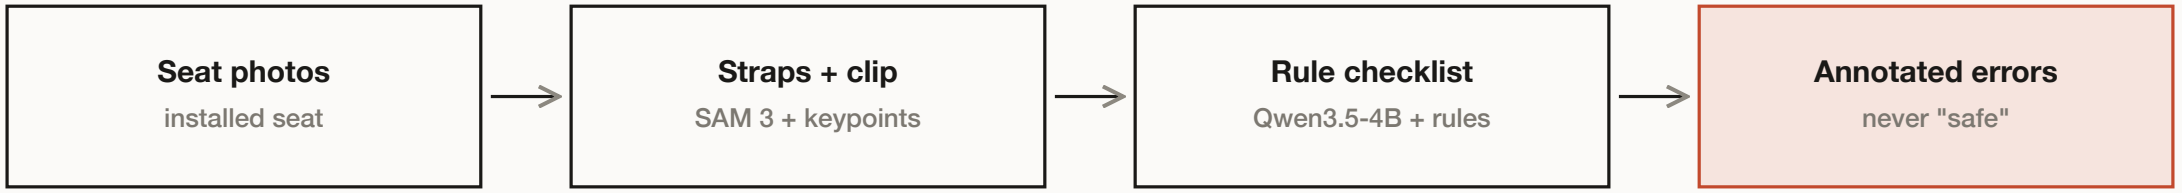

WHO BUYS IT

Child-seat retailers, and parents per check.

SeatProof

Child-seat installation coach: photos reveal visible errors and always print "tightness not verified".

HOW IT WORKS

WHY IT MATTERS

Draft Art. 128-11 proposes 30 BRV fines. Chest-clip sensors only alert; this checks the installation itself.

HOW PRACTICAL

4 bought seats, a doll, 400 photos, half misinstalled. Modal ~1.5 s, ~$0.0003 per VLM call.

WHO PAYS

Child-seat retailers at point of sale; parents 5,000 UZS per check.

JUDGE DEMO

Photograph our doll setup: errors annotated.

Moat — a misinstallation case library · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [127][128]

GateWash

Proves construction trucks leave the site with clean wheels and covered loads.

WHAT IT DOES

A camera at the site exit watches every truck pass the wheel wash. GateWash logs how long it washed, whether the load was covered and the plate, in a tamper-proof record inspectors can check.

WHY IT MATTERS

Mud and dust from building sites add to Tashkent's smog, and a draft rule covers about 1,700 sites. Developers need proof to avoid fines.

USE CASES

- A developer shows inspectors a clean record
- An inspector checks a site remotely
- A contractor finds lazy drivers

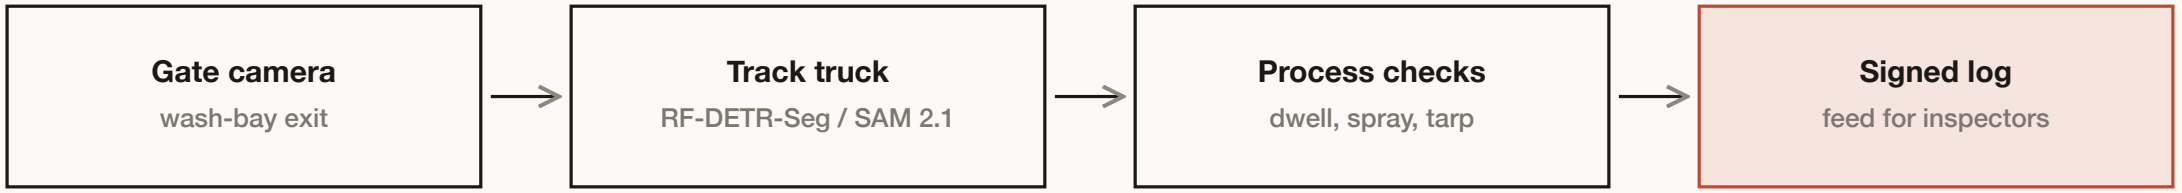

WHO BUYS IT

Construction developers and contractors.

GateWash

Construction-gate kit that logs each truck's wheel-wash dwell, spray, tarp cover and plate with a signed clip hash.

HOW IT WORKS

WHY IT MATTERS

Tashkent's draft rule covers ~1,700 construction sites in the smog push. UK Mud Cam and Delhi's dust portal prove demand; here the polluter pays for proof.

HOW PRACTICAL

Consented truck exits at 2–3 sites. Gate mini-PC or Pi 5 with AI HAT+ 2 (~$505).

WHO PAYS

Developers and contractors, ~$40 per gate-month.

JUDGE DEMO

Point a phone at a toy truck: QR receipt.

Moat — an evidence format co-designed with inspectors · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [144][145][146][147]

Plug-Ready

Checks if a new EV owner's home can safely charge the car, from a phone video.

WHAT IT DOES

When someone buys an electric car, they film their parking spot, electricity meter, fuse box and socket. Plug-Ready reads the ratings, measures the cable distance with a bank card, flags dangers and quotes the right home charger.

WHY IT MATTERS

New EV owners often charge from unsafe sockets or extension cords, which manuals forbid. A survey visit costs time; a video doesn't.

USE CASES

- A dealer sells a home charger with every EV
- A bank adds a charger to the car loan
- An owner learns they need an electrician first

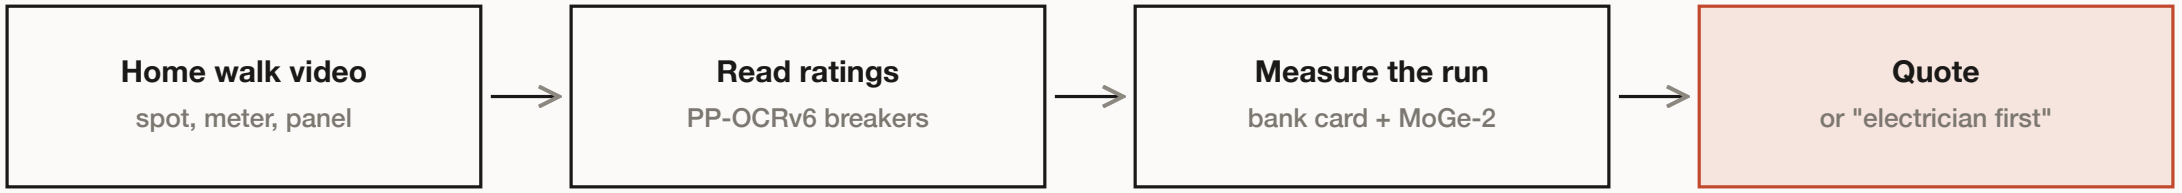

WHO BUYS IT

EV dealers and charger installers, plus banks.

Plug-Ready

Install-ready check at EV handover: film spot, meter, panel and socket; get amps, cable run, hazards and a wallbox quote.

HOW IT WORKS

WHY IT MATTERS

EV manuals forbid extension cords, yet new owners improvise. US panel-photo quoting exists; nothing fits Uzbek limits. Never outputs a "pass".

HOW PRACTICAL

80 own clips; 30+ panels checked with tape. Browser OCR, serverless L4, ~$0.01.

WHO PAYS

Chinese-EV dealers via wallbox margin, EV-loan banks, ~$4 per survey.

JUDGE DEMO

Film any socket and fuse box with a bank card.

Moat — quote-vs-install feedback · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [172][173]

ChargeMD

Explains a charger's error message in plain language, from a photo.

WHAT IT DOES

Public chargers often show error codes in Chinese or English that drivers cannot understand. The driver photographs the screen; ChargeMD explains the problem, says what to do, and reports it to the operator.

WHY IT MATTERS

An EV taxi stuck at a broken charger loses income. Operators also learn which chargers fail, helping build a reliable uptime map.

USE CASES

- A taxi driver fixes a simple charging error on the spot
- An operator gets precise fault reports
- Drivers see which chargers really work

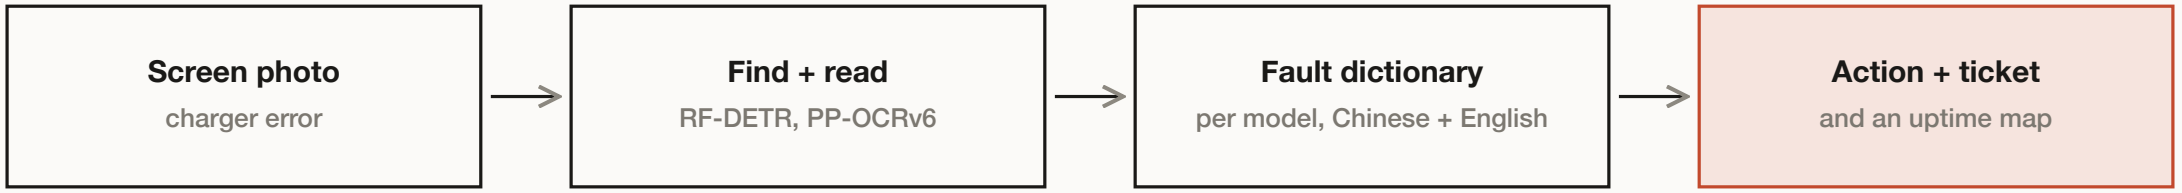

WHO BUYS IT

EV taxi fleets and charging operators.

ChargeMD

A photo of a charger's error screen becomes a plain-language action, a one-tap operator report and a verified-uptime map.

HOW IT WORKS

WHY IT MATTERS

122.7k EVs are registered and imported chargers show codes drivers cannot read. Backend reliability scores exist; screen decoding does not.

HOW PRACTICAL

Screens photographed at 40+ chargers. Server, under $0.001 per report.

WHO PAYS

EV taxi fleets; charge-point operators ~100k UZS per site-month.

JUDGE DEMO

Upload a charger photo: translated code and ticket.

Moat — fault dictionaries for imported models · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [13][175][176]

YardAudit

Counts and checks a dealer's cars against the bank's list, from a walk-around video.

WHAT IT DOES

Banks lend money to dealers against the cars in their yard. The bank's agent walks the yard filming; YardAudit reads every plate and VIN and compares them with the pledged list to find missing cars.

WHY IT MATTERS

If a dealer sells pledged cars without telling the bank, the loan loses its security. Counting by hand is slow and error-prone.

USE CASES

- A bank audits a dealer's stock in 10 minutes
- An import yard tracks cars without plates
- A lender spots missing cars early

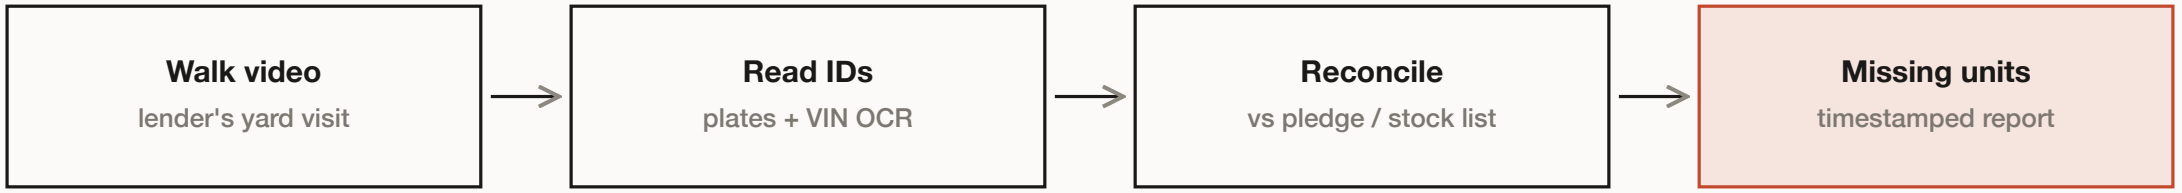

WHO BUYS IT

Banks and leasing firms that lend to dealers, and import yards.

YardAudit

VIN-first existence audit: a walk video reads plates and VINs and reconciles them with the pledge or stock list.

HOW IT WORKS

WHY IT MATTERS

Lenders with dealer credit lines need proof the stock exists. Sergeli already registers plate-less cars by QR; lender self-audit apps are not phone-only in UZS.

HOW PRACTICAL

3 staged yards with seeded missing cars; report recall. Server, under $0.05 per 2-minute video.

WHO PAYS

Banks and lessors with dealer credit lines, ~150,000 UZS per audit.

JUDGE DEMO

Film the venue car park: units found vs list.

Moat — per-dealer stock history · Report score 49/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [180][193]

TIER C · 36 IDEAS

Great demo, hard investor case

City hall is the only payer, the ticket is too small, or it is a feature of a bigger product.

PlumeWatch

Spots trucks blowing black smoke or driving with uncovered loads, from road cameras.

WHAT IT DOES

Existing roadside cameras watch passing trucks. PlumeWatch grades how dark each truck's exhaust smoke is, checks whether loads are covered, reads the plate, and keeps a list of repeat offenders for inspectors to send for repair.

WHY IT MATTERS

Vehicles cause about 16% of Tashkent's air pollution, and the city has a smog commission. Fixing the worst trucks gives the biggest gain.

USE CASES

- An ecology inspector targets the dirtiest trucks
- The smog commission tracks repairs
- A city measures progress against smog

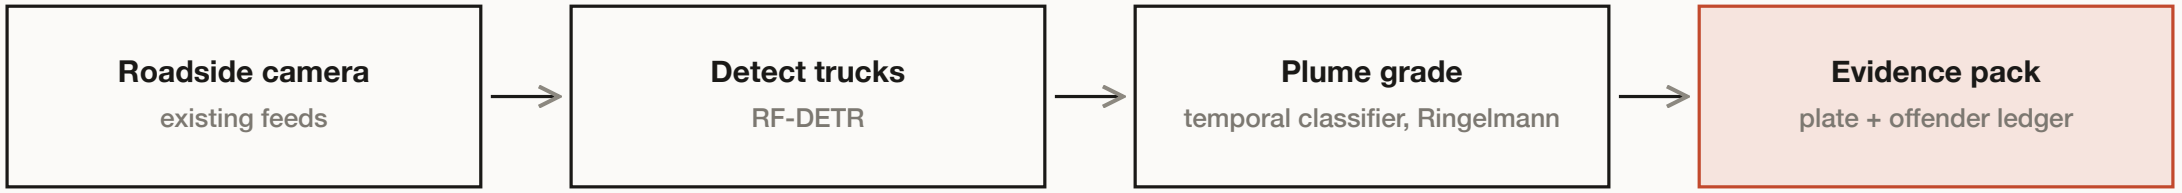

WHO BUYS IT

The city's ecology committee and smog commission.

PlumeWatch

Roadside cameras grade each truck's black smoke and tarp status, feeding a repeat-offender ledger and repair orders.

HOW IT WORKS

WHY IT MATTERS

Vehicles are ~16% of Tashkent pollution and Decree UP-229 set up a smog commission. Hong Kong's roadside sensors got 96% of flagged vehicles repaired.

HOW PRACTICAL

The public 75k-image set is not downloadable: collect 300+ local clips with condensation negatives. T4, $5–15 per camera-month, daytime only.

WHO PAYS

Ecology committee and smog commission, $30–60 per camera-month.

JUDGE DEMO

Play a roadside clip: smoke grade and PDF.

Moat — a repeat-offender ledger · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [140][141][142][143]

SightTriangle

Checks whether drivers can really see pedestrians at a crossing, from a phone video.

WHAT IT DOES

An auditor stands at the stop line and slowly pans a phone across the junction. SightTriangle finds what blocks the view, like kiosks or parked cars, and says whether a driver can see far enough to stop in time at that speed.

WHY IT MATTERS

A crossing is only safe if drivers can see who is about to cross. Blocked views cause crashes that cameras and fines don't prevent.

USE CASES

- An auditor checks new AI-camera crossings
- A city decides which kiosk to move
- A school asks for a safer crossing

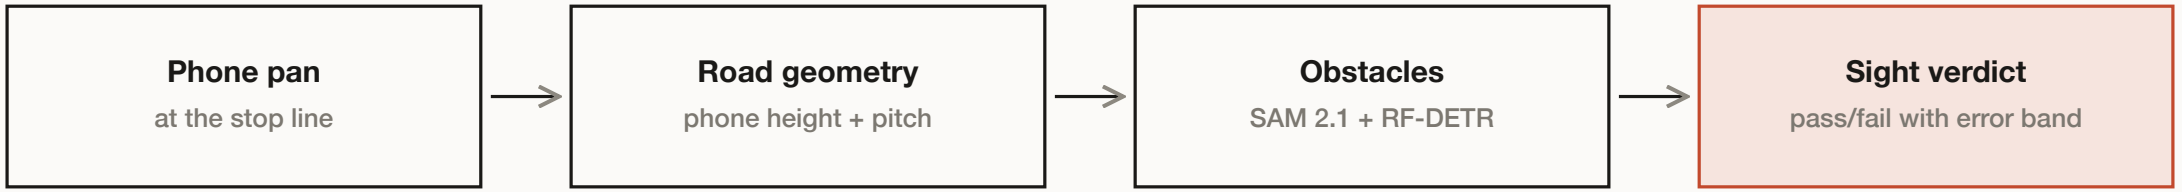

WHO BUYS IT

Road-safety audit consultants, often on development-bank projects.

SightTriangle

"Was it even visible?" A phone pan at the stop line reports blockers and pass or fail at stopping sight distance.

HOW IT WORKS

WHY IT MATTERS

Kiosks and parked cars can hide pedestrians at the new AI yield crossings. Mobile-LiDAR research does this; a phone audit does not exist yet.

HOW PRACTICAL

≥8 tape-measured corners; no far-field depth beyond ~40 m. Server, under 1 cent per audit.

WHO PAYS

Road-safety audit consultancies on development-bank projects, ~$15/audit.

JUDGE DEMO

Pan at a venue corner or hallway junction.

Moat — a per-phone depth-error model · Report score 62/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [123][148]

SwerveMap

Finds potholes and road hazards by watching how drivers swerve around them.

WHAT IT DOES

Fixed traffic cameras already film every road. SwerveMap tracks the cars, and when many drivers swerve at the same spot, it marks a hazard, like a pothole, open manhole or gravel, and ranks spots for repair.

WHY IT MATTERS

Tashkent's Safe City system has 42,750 cameras but no one watches for road damage. Drivers' behaviour reveals hazards without anyone labelling potholes.

USE CASES

- The road agency gets a ranked repair list
- A city finds dangerous spots early
- An insurer sees accident-prone points

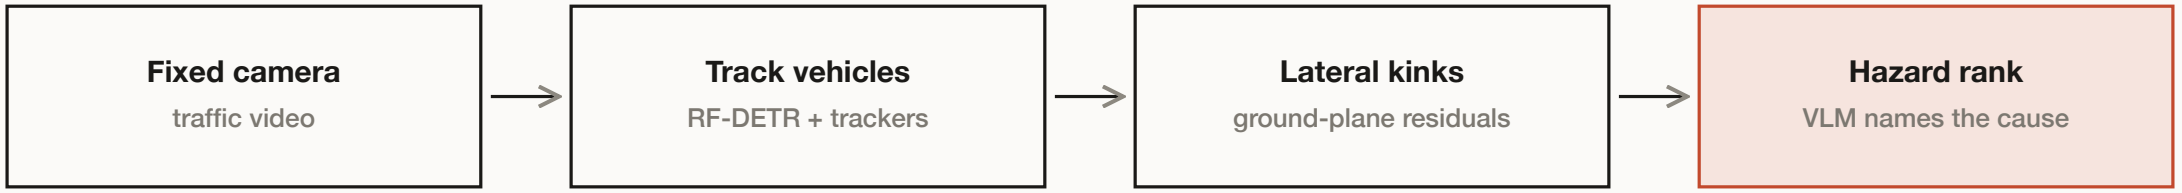

WHO BUYS IT

The road agency and city hall.

SwerveMap

Fixed cameras reveal road hazards from behaviour: repeated swerves at one spot rank potholes, open lids and gravel.

HOW IT WORKS

WHY IT MATTERS

Tashkent Safe City runs 42,750 cameras. Pavement-image AI is a hard business (Michelin exited); behaviour needs no defect labels.

HOW PRACTICAL

UA-DETRAC, a staged cone-dodge, RDD2022 for causes. Server at 5 FPS; needs an L4 or edge box for margin.

WHO PAYS

Road agency or khokimiyat, ~$25 per camera-month.

JUDGE DEMO

Play a clip with a hidden obstacle: swerve heatmap.

Moat — label-free per-lane baselines · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [149][150]

ForcedOnRoad

Maps sidewalks too narrow or blocked, forcing pedestrians into traffic.

WHAT IT DOES

Someone walks a street filming the sidewalk. ForcedOnRoad measures the free width and finds where parked cars or kiosks leave less than 1.2 m, so pedestrians must step onto the road. It ranks blocks by danger.

WHY IT MATTERS

Pedestrians are involved in about 46% of crashes. Knowing exactly where to put bollards or move parking saves lives cheaply.

USE CASES

- A city decides where to place bollards
- The parking operator moves bays off sidewalks
- Activists document unsafe streets

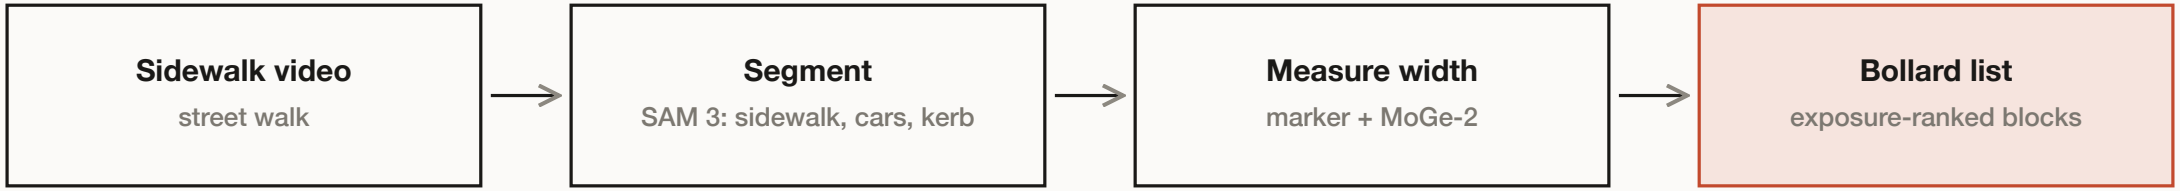

WHO BUYS IT

City hall and the city's parking operator.

ForcedOnRoad

Map of sidewalks under 1.2 m free width, with error bands, ranking blocks where pedestrians are forced into traffic.

HOW IT WORKS

WHY IT MATTERS

Pedestrians were in ~46% of crashes. Crowd labelling exists; measured width does not. Monocular width error is 0.252 m.

HOW PRACTICAL

20 blocks filmed at rush hour, 100 tape points. Server, ~1 cent per km.

WHO PAYS

Khokimiyat or the parking concessionaire, ~$60 per street-km.

JUDGE DEMO

Upload a sidewalk video: width strip.

Moat — an exposure-ranked block database · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [124][151][152]

Rain-Ready

Finds blocked storm drains before a big rain, so streets don't flood.

WHAT IT DOES

Cameras on buses and city vehicles photograph storm drains as they drive. Rain-Ready grades how clogged each drain is and, before a forecast storm, gives the district a cleaning list starting with the lowest, most flood-prone streets.

WHY IT MATTERS

Clogged drains flood streets and underpasses, stranding cars. Cleaning the right drains before the rain is far cheaper than dealing with floods.

USE CASES

- A district cleans the worst drains before a storm
- Fleets get warnings about flooded underpasses
- A city tracks drain upkeep

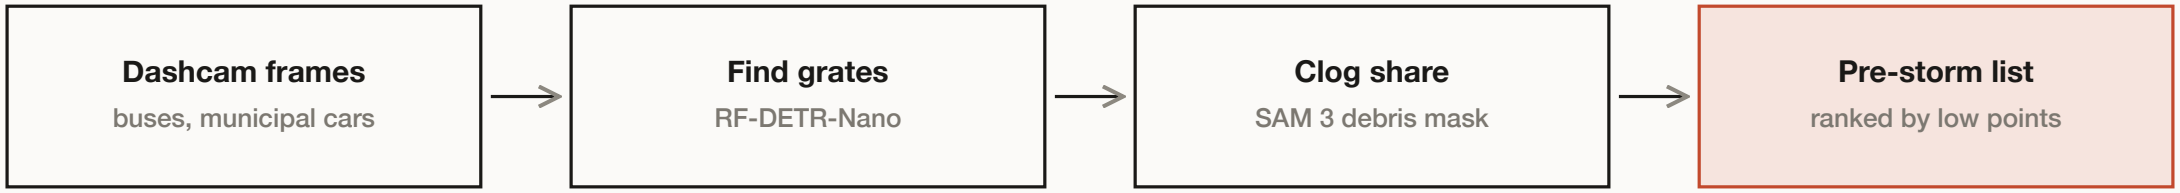

WHO BUYS IT

District administrations and storm-water utilities.

Rain-Ready

Bus dashcams score storm-drain clogging; before each forecast storm the district gets a cleaning list.

HOW IT WORKS

WHY IT MATTERS

Road-asset apps catalogue drains but not clog severity tied to a forecast; fleets also get underpass-closure alerts.
Open-Meteo's free API is non-commercial.

HOW PRACTICAL

400 own grate photos plus public sets; back-test against a past flood. Server, ~$0.02 per km.

WHO PAYS

District hokimiyats and storm-water utilities, ~$0.50 per inlet.

JUDGE DEMO

Photograph a street drain near the venue.

Moat — clog history linked to flood outcomes · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [153][154]

SchoolGate

Measures how dangerous a school's drop-off zone is, in a 10-minute phone video.

WHAT IT DOES

A phone propped near the school gate records pickup time. SchoolGate counts double-parked cars, blocked crossings, U-turns and drivers who don't stop for children, then sends a one-page report with three fixes.

WHY IT MATTERS

Children are hard for drivers to see, and school zones get chaotic. Numbers before and after a change show what really works.

USE CASES

- A school shows the city its danger hotspots
- A city measures a new crossing's effect
- Parents push for changes with real data

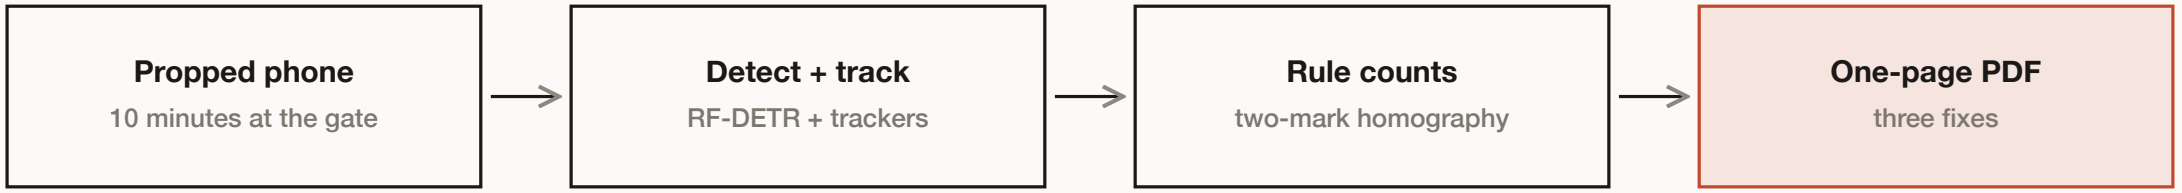

WHO BUYS IT

City hall, school-safety programmes and donors.

SchoolGate

A propped phone at school pickup counts double-parking, blocked crossings, U-turns and yield rate; report via Telegram.

HOW IT WORKS

WHY IT MATTERS

A 2023 decree orders cameras near schools. Studies rely on installed cameras; a 10-minute phone audit gives before/after numbers cheaply.

HOW PRACTICAL

1–2 consented gates plus one dusk or rain clip. T4 batch, ~$0.05 per audit.

WHO PAYS

Khokimiyat, school-safety programmes, donors, ~$20 per audit.

JUDGE DEMO

Record the venue entrance: counts and PDF.

Moat — a school-zone benchmark · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [155][156]

OverpassIgnored

Shows whether people actually use pedestrian bridges, or still cross the road below.

WHAT IT DOES

A camera films a pedestrian bridge or underpass. OverpassIgnored follows the people and counts who uses the stairs and who crosses at street level, and where they climb fences, showing whether the investment works.

WHY IT MATTERS

Cities spend a lot on pedestrian bridges that many people avoid. Studies found usage anywhere from 11.6% to 93.7%.

USE CASES

- A city decides where to add fences or crossings
- Auditors check a bridge's value
- Planners choose better designs

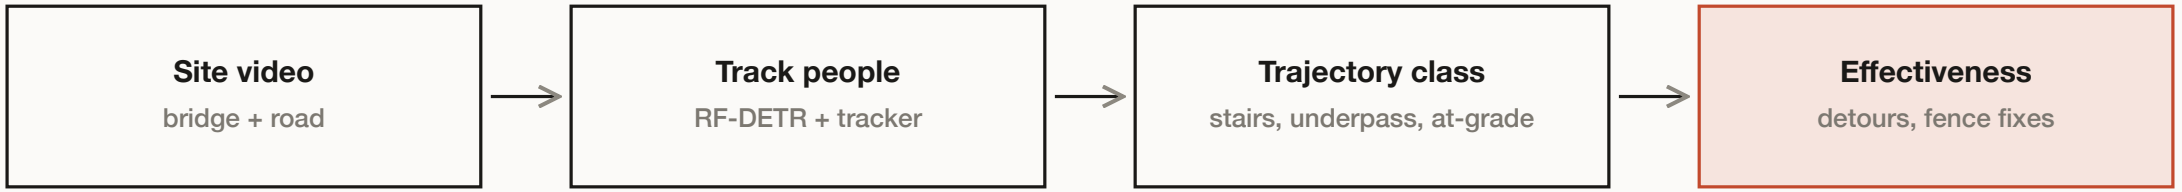

WHO BUYS IT

City capital-works departments and auditors.

OverpassIgnored

Measures whether people use pedestrian bridges and underpasses or cross at grade, plus driver yield at zebras.

HOW IT WORKS

WHY IT MATTERS

Bridge use ranged from 11.6% to 93.7% in academic counts (one figure from a search snippet). Tashkent's RRFB pilot has no evaluation plan.

HOW PRACTICAL

1–2 pre-recorded sites, faces blurred. T4 ~10 min per 2-hour clip, ~$0.10.

WHO PAYS

Khokimiyat capital-works holders and auditors, ~$150 per site.

JUDGE DEMO

Play a 5-minute bridge clip: usage split.

Moat — a city-wide usage database · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [157][158][159]

Ruxsat

Audits EV charging sites against the regulator's checklist, from a phone video.

WHAT IT DOES

An inspector films the charging site. Ruxsat reads the charger nameplates, finds the meter and the official verification marks, and checks everything against the rules, giving a pass, a fix-list or a hold.

WHY IT MATTERS

In March 2026, 101 Tashkent chargers were cut off over paperwork, and regular audits are planned. Operators want to pass before inspectors come.

USE CASES

- An operator self-checks all sites before an audit
- An inspector audits faster
- A new site launches without paperwork surprises

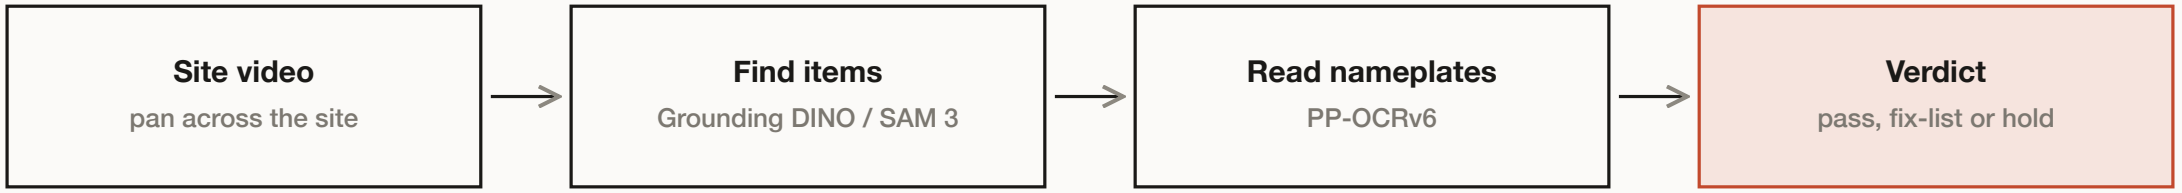

WHO BUYS IT

City inspection teams and charging operators.

Ruxsat

Charger-site audit aimed at what the regulator checks: nameplate kW, verification mark, meter and feeder photos.

HOW IT WORKS

WHY IT MATTERS

101 Tashkent chargers were cut off over paperwork in March 2026, and 2-year audits are planned.

HOW PRACTICAL

15 sites; the checklist confirmed by one operator first. Hosted VLM on 12 keyframes, ~$0.004–0.014.

WHO PAYS

Hokimiyat teams and operators with 20+ sites, ~200k UZS per audit.

JUDGE DEMO

Pan across our mock charger-site poster.

Moat — a decree-tracked checklist · Report score 59/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [115][160][161]

SunkenLid

Finds open, broken or sunken manhole covers and alerts the right utility.

WHAT IT DOES

Dashcams or citizens' phones photograph the street. SunkenLid finds manhole covers, decides if each is flush, sunken, broken or open, and sends a ticket to the utility that owns it.

WHY IT MATTERS

Open or broken covers injure pedestrians and damage cars, especially at night. Several utilities own covers, so problems sit unreported.

USE CASES

- A water utility gets a list of its broken covers
- A citizen reports a dangerous hole in one photo
- A district audits its streets

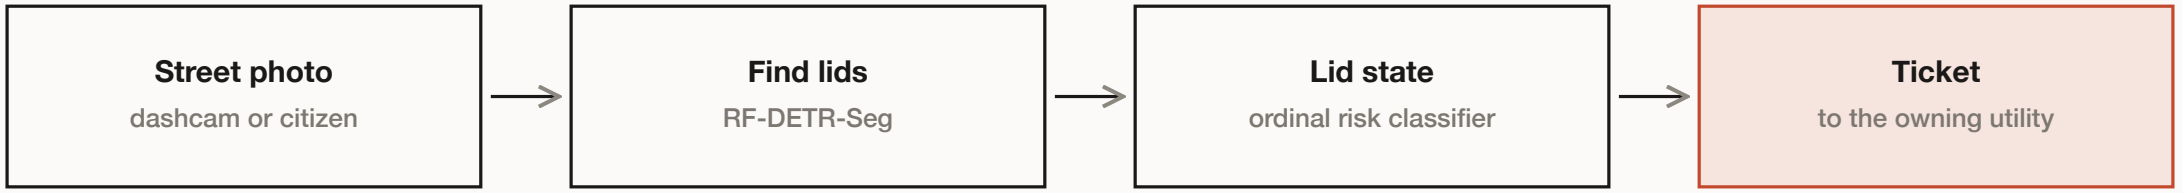

WHO BUYS IT

City hall and the utilities that own the covers.

SunkenLid

Night-first manhole alerts: classify each lid as flush, sunken, broken or open and route a ticket to the owning utility.

HOW IT WORKS

WHY IT MATTERS

Cologne's phone pilot found lids easier to detect than road damage. Road-asset apps list manholes; routing to the 3–4 owning utilities is the gap.

HOW PRACTICAL

20+ real Tashkent photos with precision and recall; FLUX.2 klein lid removal. Server ~0.4 s.

WHO PAYS

Khokimiyat and the lid-owning utilities, as a district audit.

JUDGE DEMO

Upload a street photo: lid state.

Moat — a lid registry with owners · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [153][162]

DustVis

Turns existing road webcams into fog and dust-storm warning sensors.

WHAT IT DOES

DustVis looks at fixed objects in each webcam image, like poles and buildings at known distances. The haze over them shows how far drivers can see, so it posts fog and dust-storm alerts when visibility drops.

WHY IT MATTERS

Low visibility causes chain crashes on highways. In January 2026, fog cut visibility to 50-100 m and diverted 26 flights.

USE CASES

- A highway authority warns drivers on electronic signs
- Emergency services prepare for bad visibility
- Fleets delay trips through dust storms

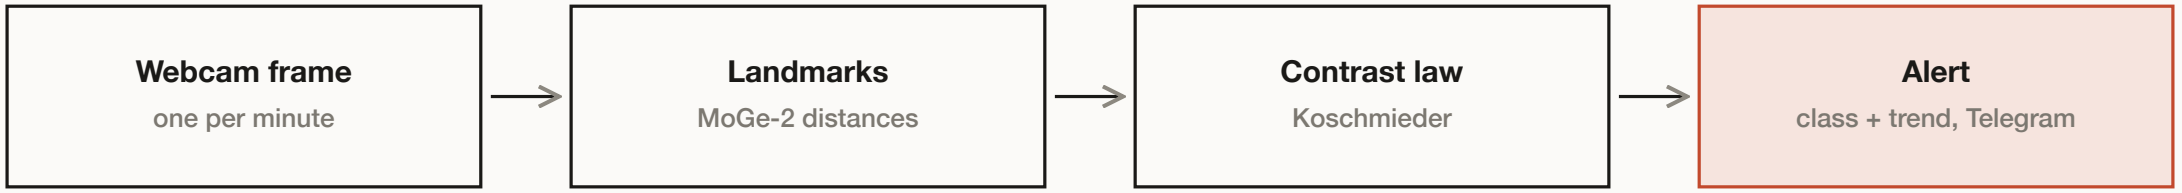

WHO BUYS IT

The road agency and the emergency ministry.

DustVis

Existing webcams as visibility meters: 4–5 visibility classes from landmark contrast, posting fog and dust alerts.

HOW IT WORKS

WHY IT MATTERS

Fog cut visibility to 50–100 m and diverted 26 flights on 8–9 Jan 2026. The best CCTV model scores 81.76% on five classes; nobody sells it as a service.

HOW PRACTICAL

Finnish camera plus visibility-sensor pairs; replay a real fog event. CPU, under $2 per camera-month. Daylight only.

WHO PAYS

Road agency and emergency ministry, ~$20 per camera-month.

JUDGE DEMO

Watch a recorded fog event beside the sensor trace.

Moat — per-camera calibration · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [163][164][165]

GhostWorks

Checks whether road works actually happen during the hours a lane is closed.

WHAT IT DOES

A camera films a road-work zone through the day. GhostWorks measures how much of the road is closed and whether workers and machines are actually working, then compares that with the permitted hours.

WHY IT MATTERS

Closed lanes with nobody working cause needless traffic jams. Tashkent is repairing 36 km of road in 2026.

USE CASES

- The traffic centre checks contractors' real working hours
- A city fines idle closures
- Contractors get a fair record of their work

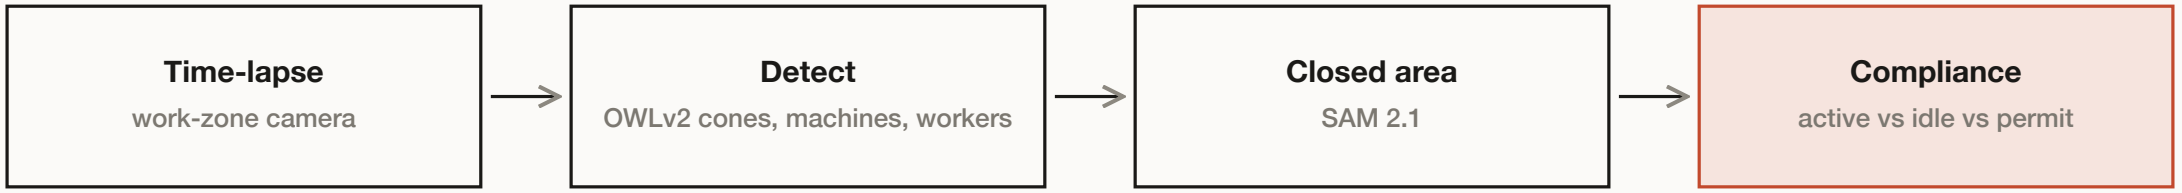

WHO BUYS IT

The city traffic centre and city hall.

GhostWorks

Permit-hours compliance for road work zones: lane-metres closed vs active, compared with permitted hours.

HOW IT WORKS

WHY IT MATTERS

Tashkent repairs 36 km of road in 2026. FHWA's WorkZoneX (mAP 74.1%) costs $4,885 a year city-wide; permit compliance is its own board's next step.

HOW PRACTICAL

1–2 pre-captured sites plus public time-lapses. T4 ~7 min per zone-day, ~$0.07.

WHO PAYS

Traffic centre or khokimiyat, ~$100 per zone-month.

JUDGE DEMO

Scrub an 8-hour time-lapse: idle bands.

Moat — contractor history · Report score 54/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [166][167]

PatchLedger

Proves a road repair was really done, using street photos from before and after.

WHAT IT DOES

Street-level photos from past years are compared with a new drive. PatchLedger finds where a patch exists now that did not before, and records it with time and place so it can't be faked.

WHY IT MATTERS

Road repairs are sometimes paid for but never done. Auditors found signs of collusion in 200 road-testing tenders in Karakalpakstan.

USE CASES

- An auditor checks repairs before paying a contractor
- An anti-corruption body tracks road spending
- A city verifies its repair map

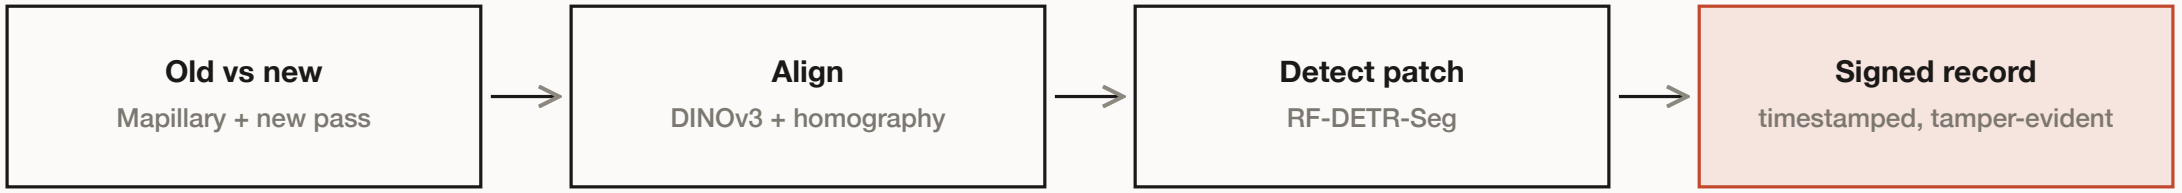

WHO BUYS IT

Audit and anti-corruption bodies.

PatchLedger

Repair-acceptance proof: multi-year street imagery plus a new pass proves a patch exists where it did not before.

HOW IT WORKS

WHY IT MATTERS

200 Karakalpak road-testing tenders showed collusion signs. Road-asset apps track repairs, not acceptance evidence.

HOW PRACTICAL

Mapillary Tashkent pairs (check coverage first, drop if none); RDD2022. Overnight server, ~0.5 cent per km.

WHO PAYS

Audit and anti-corruption bodies, per-km fee.

JUDGE DEMO

Slide between two visits of one street.

Moat — longitudinal segment history · Report score 52/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [153][168][169]

TIER C · 68 / 91 · CITY HALL

StopCount

Independently checks whether "green-wave" traffic lights really cut stops.

WHAT IT DOES

Cameras or dashcam runs along a corridor record traffic. StopCount measures how many cars arrive on green, how often they stop and how long trips take, before and after a signal change.

WHY IT MATTERS

Cities announce big gains from smarter traffic lights without showing a method. One avenue claimed 29% less travel time with no evidence.

USE CASES

- City leaders verify a contractor's claims
- A lender checks a funded project's results
- Engineers tune signals with real data

WHO BUYS IT

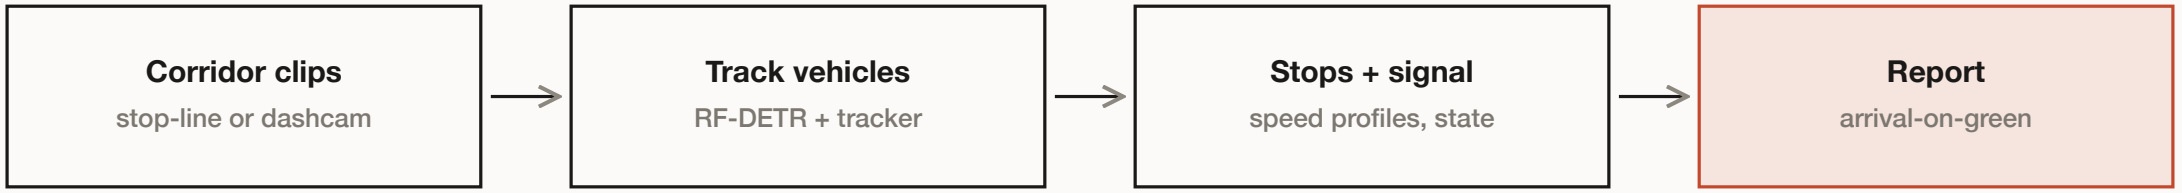

City hall, and lenders' verification agents.

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [170][171]

StopCount

Independent check of green-wave claims: measures arrival-on-green, stop rate and platoon travel time on live corridors.

HOW IT WORKS

WHY IT MATTERS

Buyuk Ipak Yuli claimed –29% travel time with no method. Google Green Light claims up to 30% fewer stops; independent measurement is missing.

HOW PRACTICAL

Own clips, no plates stored. T4 batch, ~$3–15 per corridor-day.

WHO PAYS

Khokimiyat leadership or lender verification agents, ~$500/corridor.

JUDGE DEMO

View a time-space diagram from our corridor clips.

Moat — corridor baselines · Report score 49/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [170][171]

FineFirewall

Checks whether a traffic light's yellow is long enough, before drivers are fined.

WHAT IT DOES

A video of the junction is enough. FineFirewall measures the yellow light's duration, how fast cars approach, and how many drivers are caught in the zone where they can neither stop nor pass safely.

WHY IT MATTERS

A yellow just one second longer cut violations by 36% in one study. Fines from a short yellow are unfair and don't improve safety.

USE CASES

- A city fixes signals that trap drivers
- A fleet challenges unfair fines
- A signal programme proves its timing is fair

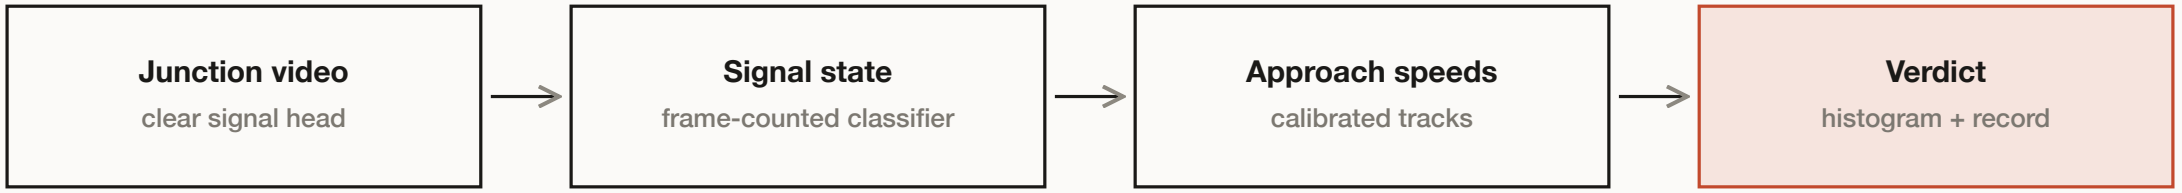

WHO BUYS IT

Signal-timing programmes and fleets.

FineFirewall

Junction video measures yellow duration, red-entry timing and dilemma-zone share against engineering requirements.

HOW IT WORKS

WHY IT MATTERS

A ~1 s longer yellow cut violations 36%. The Uzbek minimum yellow time was not found: confirm it before pitching.

HOW PRACTICAL

Own clear-signal junction clip (the elimination camera's signal head is small and often occluded). T4 ~2 min per 5-minute 4K clip.

WHO PAYS

Signal-timing programmes and fleets, ~$200 per junction audit.

JUDGE DEMO

Open a junction page: yellow time and histogram.

Moat — a per-junction fairness record · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [187][188][189]

BumpRegistry

Maps speed bumps and flags ones that are illegal or dangerous.

WHAT IT DOES

As vehicles drive, dashcams and phones record every speed bump: where it is, its spacing, signs, markings and lighting, plus a rough height from the phone's motion sensor. BumpRegistry builds a map and a list of bumps to fix or remove.

WHY IT MATTERS

Homemade bumps damage cars and slow ambulances; one 426 m street in Bukhara has 10 bumps. No one keeps a full register.

USE CASES

- Ambulances get routes with fewer bumps
- A district removes illegal bumps
- Taxi fleets avoid damaging streets

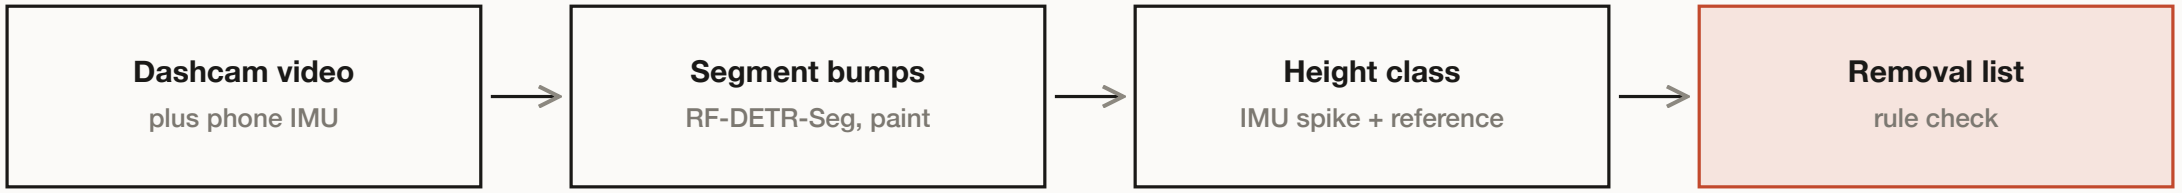

WHO BUYS IT

Emergency services or a district; taxi fleets for routing.

BumpRegistry

Speed-bump inventory from dashcam video: presence, spacing, signs, markings, lighting and a coarse height class.

HOW IT WORKS

WHY IT MATTERS

Philadelphia found 2 of 140 cushions installed properly; one 426 m Bukhara street has 10 bumps. No CV legality audit was found.

HOW PRACTICAL

30 tape-measured bumps for error bars. T4 ~0.3 s per frame, ~1 cent per km.

WHO PAYS

Emergency services or one district; taxi fleets ~$5 per vehicle-month.

JUDGE DEMO

Upload our five-bump clip: registry rows.

Moat — a registry with owner status · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [183][184]

Lane Clear

Checks whether a fire truck can get through a courtyard full of parked cars.

WHAT IT DOES

Someone walks through the courtyard filming with a phone. Lane Clear builds a 3D map, finds the narrow spots under 3.5 m, and shows which parked cars or bays block a fire truck.

WHY IT MATTERS

In apartment courtyards, parked cars often block the way for fire trucks and ambulances. In a fire, minutes lost can cost lives.

USE CASES

- A housing association decides where to ban parking
- The fire service audits courtyards
- Residents show the problem with real numbers

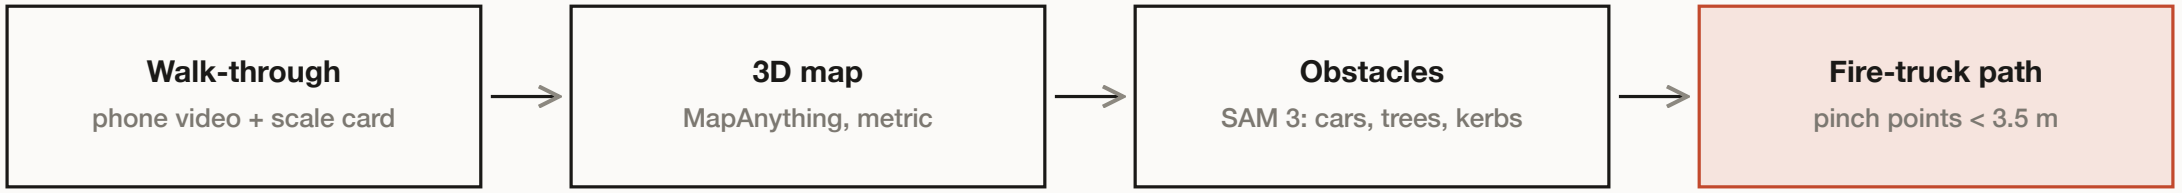

WHO BUYS IT

Housing associations, mahalla committees and the fire service.

Lane Clear

A courtyard phone walk-through becomes a 3D free-space map: can a fire truck get through, and which bays to ban?

HOW IT WORKS

WHY IT MATTERS

Tashkent has ~193 vehicles per 1,000 people. Dahua alarms on fire-lane dwell; nobody measures passability in one pass.

HOW PRACTICAL

Tape-measured widths in ≥10 courtyards; MapAnything width error 0.33–0.46 m. Serverless GPU ~10 s per clip, ~$0.05.

WHO PAYS

Housing associations, mahalla committees, fire service, $20–40/audit.

JUDGE DEMO

Film a corridor lined with chairs: pinch points.

Moat — a courtyard database by hour · Report score 64/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [137][138][139]

Bead-Check

Measures how well a car's protective coating still repels water.

WHAT IT DOES

A water drop is placed on the paint and filmed from the side. Bead-Check measures the drop's angle: a high angle means the coating still works. Repeat checks show when the car needs re-coating.

WHY IT MATTERS

Detailers sell expensive ceramic coatings but can't prove how they last. A lab device costs $4,990; this uses a phone.

USE CASES

- A detailer gives customers a coating certificate
- A studio reminds customers when to re-coat
- A dealer backs a paint-protection warranty

WHO BUYS IT

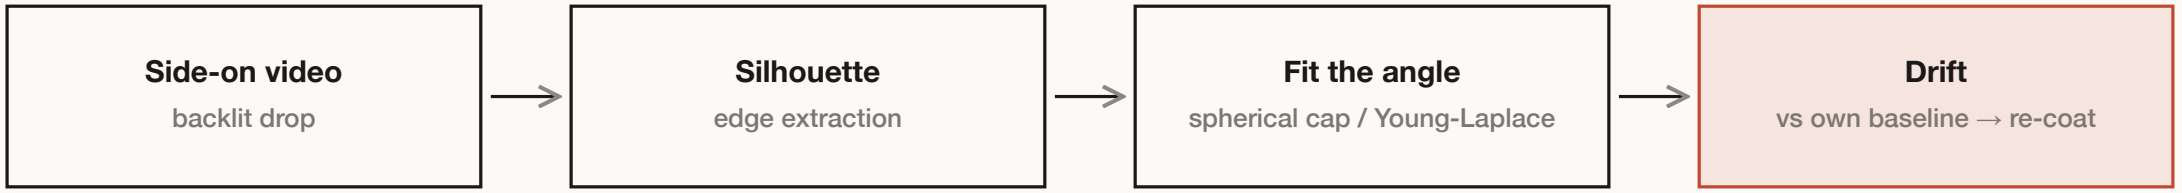

Detailing studios and dealers' paint programmes.

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [70][71]

Bead-Check

Coating drift tracker: a pipetted water drop filmed side-on gives the contact angle; later drops flag a re-coat.

HOW IT WORKS

WHY IT MATTERS

A lab drop analyser costs $4,990 and the free Joninn app fails above 85°, exactly where ceramic coatings sit.

HOW PRACTICAL

12 coupons (bare, wax, sealant, ceramic), 400 drops. In-browser under 1 s, ~zero cost.

WHO PAYS

Studios $15/month plus $2 per certificate; dealer paint programmes.

JUDGE DEMO

Drop water on our coupons or your phone screen.

Moat — coating-life curves per product · Report score 63/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [70][71]

Dent-Lines

Finds small dents and repainted areas using light stripes from a laptop screen.

WHAT IT DOES

A laptop shows black-and-white stripes that reflect in the car's glossy paint. Where the panel is dented or filled, the stripes bend. Dent-Lines measures the bending and maps the problem area.

WHY IT MATTERS

Small dents and filler hide past damage, and dent-repair technicians quote by eye. A phone and laptop replace expensive scanning tunnels.

USE CASES

- A buyer finds hidden filler in a door
- A dent technician quotes accurately
- An inspector documents panel condition

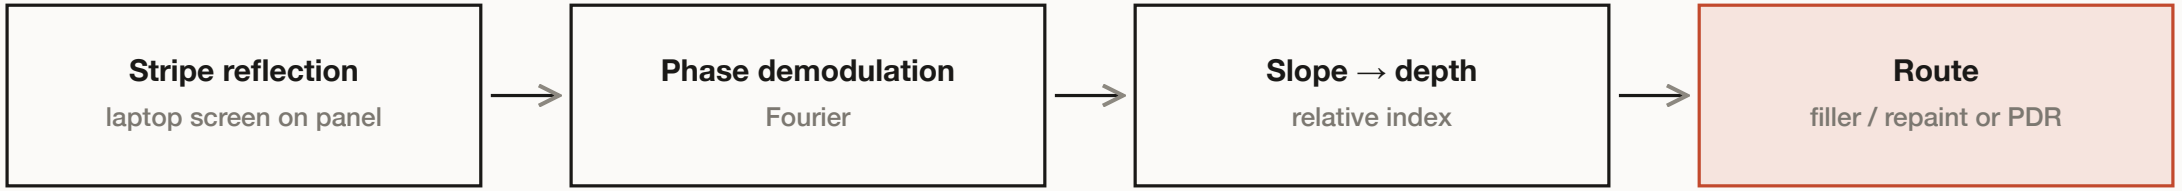

WHO BUYS IT

Car inspectors and paintless-dent-repair technicians.

Dent-Lines

Laptop-screen stripes reflected in a glossy panel map waviness: filler and repaint, or a dent for paintless repair.

HOW IT WORKS

WHY IT MATTERS

52.6k used-car deals in Sep 2025 need cheap panel checks. A drive-through grid patent needs a tunnel; a phone and laptop are enough.

HOW PRACTICAL

Dented sheets with dial-gauge depths; ~10 gauge-checked panels. In-browser under 1 s.

WHO PAYS

Avtopodbor per panel scan, or PDR technicians $15/month.

JUDGE DEMO

Photograph our dented sheet with stripes reflected.

Moat — panel-type outcome data · Report score 55/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [86][87]

WearMap

Tracks tyre wear on taxi cars every month to catch alignment problems.

WHAT IT DOES

Each month the depot photographs all four tyres of each car with a coin for scale. WearMap measures how each tyre wears and flags uneven wear that means the wheels need alignment.

WHY IT MATTERS

Bad alignment eats tyres fast. Tyre apps already exist, so the fleet-level history is what is new; this is a low-priority idea.

USE CASES

- A taxi park schedules alignment only when needed
- A fleet cuts tyre spending
- An alignment shop gets regular customers

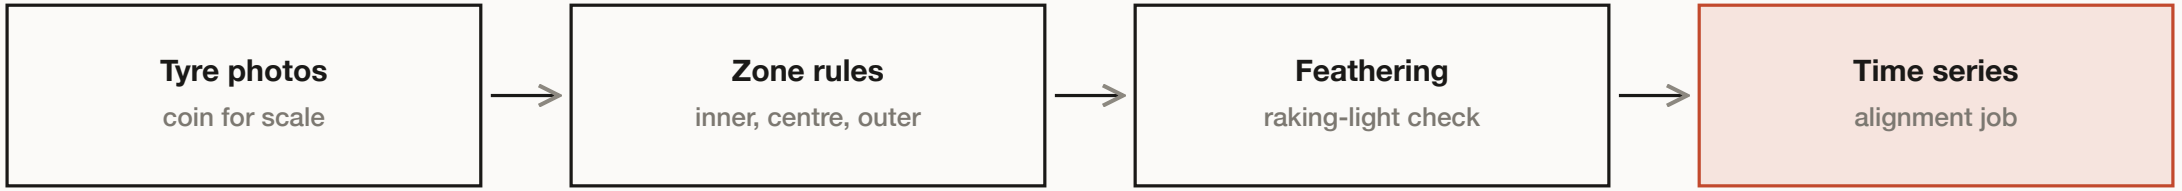

WHO BUYS IT

Taxi parks and alignment shops.

WearMap

Monthly four-wheel tread scan per taxi-park car: per-wheel wear rate, alignment scheduling, tyre-spend savings.

HOW IT WORKS

WHY IT MATTERS

HVI and several 2025–26 tyre apps already hint at alignment, so only the fleet time series is new. Low priority.

HOW PRACTICAL

200 scrap tyres with depth-gauge truth. In-browser ~2 s, under $0.002.

WHO PAYS

Taxi parks $0.50 per vehicle-month; alignment shops $20/month.

JUDGE DEMO

Photograph cut tyre sections beside a coin.

Moat — fleet wear time series · Report score 53/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [88][89]

BeamAim

Checks if headlights are cloudy or aimed wrong, from a photo of their beam on a wall.

WHAT IT DOES

Park facing a wall and switch on the lights. BeamAim checks if the beam's cut-off line is too high or too low, and grades how cloudy the lenses are, suggesting adjustment or restoration.

WHY IT MATTERS

Headlights aimed too high blind oncoming drivers; one study found 75% of vehicles mis-aimed. Cloudy lenses make night driving darker.

USE CASES

- A restoration shop shows customers the problem
- A tyre shop adds a quick light check
- A driver checks lights before a trip

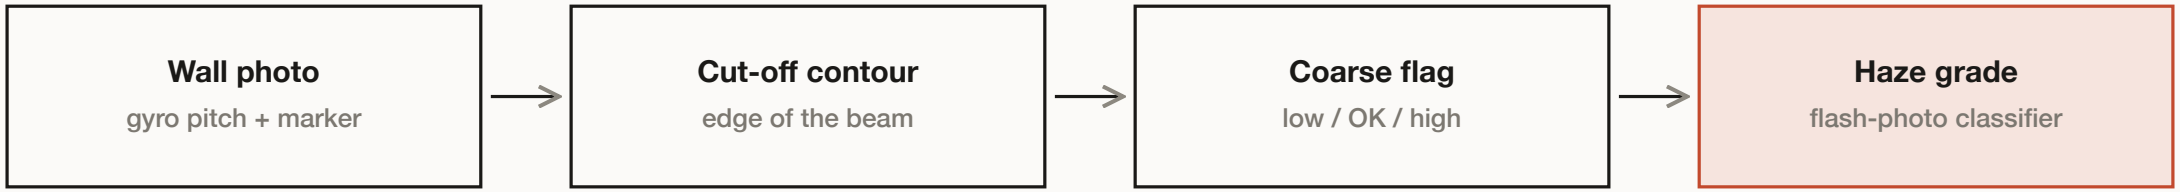

WHO BUYS IT

Headlight restoration and tyre shops.

BeamAim

Lens-haze grade plus a coarse low/OK/high headlight cut-off flag from a wall photo, sold as an upsell and pre-check.

HOW IT WORKS

WHY IT MATTERS

75% of vehicles in a TU Darmstadt study were mis-aimed. Lane testers such as Corghi PFT CAM need an inspection station.

HOW PRACTICAL

15 cars at known dial positions; 200 graded lenses. In-browser under 1 s.

WHO PAYS

Restoration and tyre shops, $0.30 per check or $15/month.

JUDGE DEMO

Point a torch at our wall board with a cut-off mask.

Moat — a beam library including LED retrofits · Report score 53/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [90][91]

PlugLens

Reads a used spark plug's condition from a close-up photo.

WHAT IT DOES

The mechanic photographs a removed spark plug. PlugLens measures the gap, classifies the deposits that show how the engine runs, and prints a job card with a re-order button.

WHY IT MATTERS

Gas-converted engines wear plugs differently than petrol ones, but mechanics read plugs by eye. This is a low-priority idea.

USE CASES

- A conversion shop documents engine health
- A mechanic orders the right plugs
- A fleet tracks plug wear on gas cars

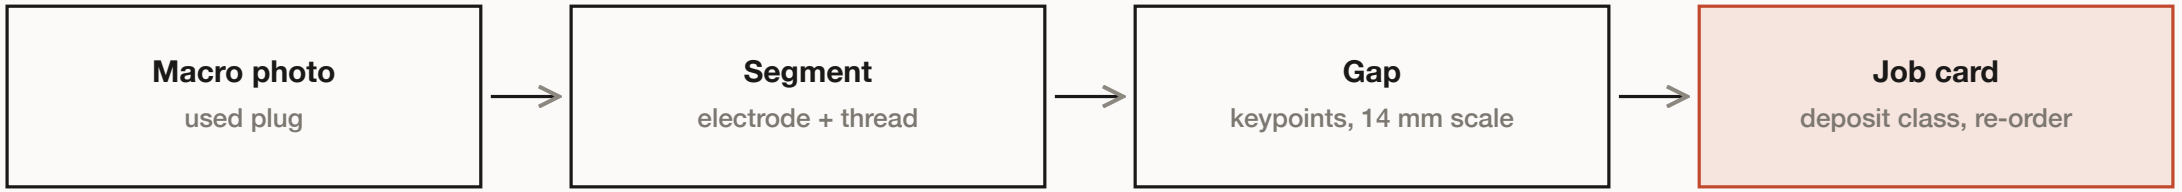

WHO BUYS IT

Gas-conversion shops and independent mechanics.

PlugLens

Spark-plug evidence card for petrol-gas conversions: gap measured against the 14 mm thread, deposit class, re-order.

HOW IT WORKS

WHY IT MATTERS

Chart-based plug apps exist and mechanics read plugs by eye. The novelty is the first CNG-vs-petrol wear curves. Low priority.

HOW PRACTICAL

~300 used plugs with mileage and fuel type; an open BSD-3 plug set for pretraining. In-browser ~1 s.

WHO PAYS

CNG-conversion shops and independent mechanics, $12/month.

JUDGE DEMO

Photograph our used plugs: gap and deposit class.

Moat — a CNG wear library · Report score 56/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [82][83]

KitCheck

Checks a vehicle's safety kit: fire extinguisher, first-aid kit and warning triangle.

WHAT IT DOES

The driver photographs the kit. KitCheck finds each item, reads the extinguisher's pressure gauge and the expiry dates, and sends Telegram reminders before anything expires.

WHY IT MATTERS

Expired extinguishers fail when needed, and passenger carriers are inspected. Reading expiry dates automatically is the hard, useful part.

USE CASES

- A bus company keeps every vehicle's kit valid
- A driver gets a reminder before inspection
- A fleet manager sees kit status at a glance

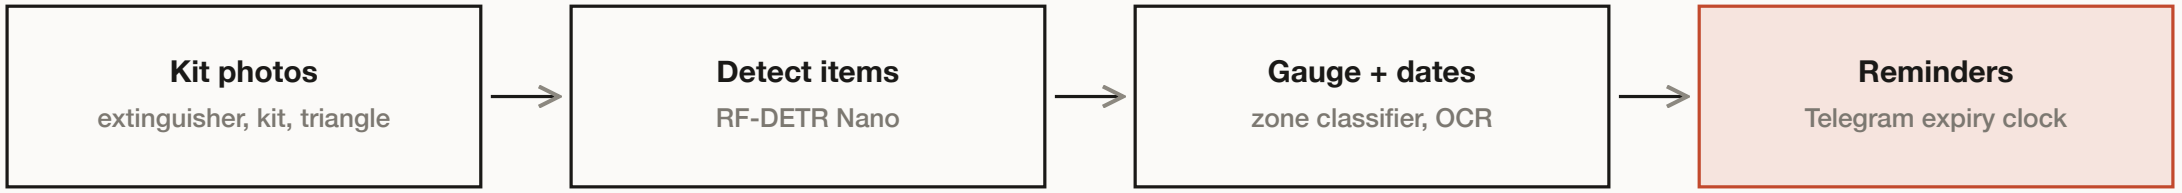

WHO BUYS IT

Passenger carriers, bundled with ShiftGate.

KitCheck

In-vehicle kit module for ShiftGate: extinguisher gauge zone and expiry date, first-aid kit, triangle, reminders.

HOW IT WORKS

WHY IT MATTERS

A YOLOv8n study found gauges and labels but could not read dates; expiry-date OCR is the real gap. Taxis stay outside the voluntary-inspection regime.

HOW PRACTICAL

60 own extinguishers and kits; synthetic gauge renders. In-browser ONNX ~0.3 s, $0 server.

WHO PAYS

Passenger carriers under mandatory inspection, ~$1 per vehicle-month.

JUDGE DEMO

Point a phone at any extinguisher in the building.

Moat — thin; sold bundled into ShiftGate · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [131][132]

Seen-at-Night

Tests whether workers' high-visibility clothing still reflects light.

WHAT IT DOES

Take two photos of the vest or jacket, with and without flash. Seen-at-Night compares how strongly the reflective stripes shine against a reference swatch, and flags clothing that is worn out after many washes.

WHY IT MATTERS

Washed-out hi-vis looks fine by day but disappears in headlights. In one study, vests without good stripes were no better than black clothing.

USE CASES

- A road crew checks its vests every month
- A courier company replaces worn jackets
- A cleaning contractor proves workers are visible

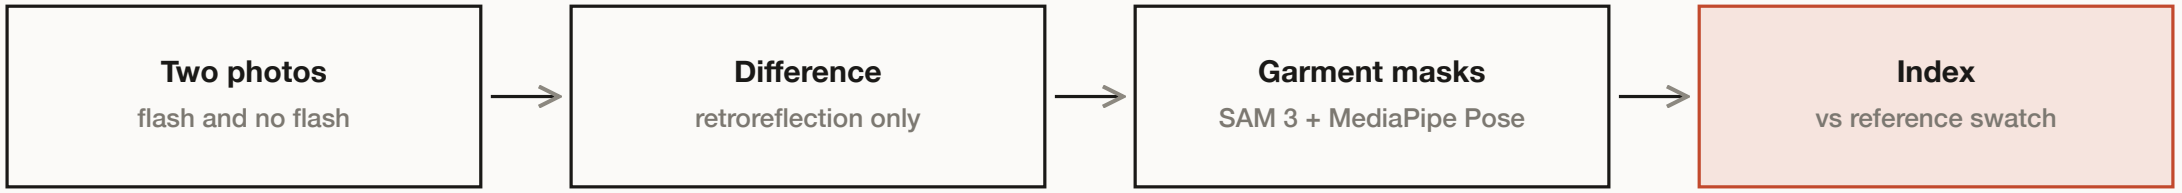

WHO BUYS IT

Employers of night-shift road workers, cleaners and couriers.

Seen-at-Night

Wash-cycle audit of hi-vis clothing: flash and no-flash pairs give a retro-gain index against a reference swatch.

HOW IT WORKS

WHY IT MATTERS

Vests without stripes were no better than black clothing in one study. Remote retroreflectometers target road signs, not clothing.

HOW PRACTICAL

A 60-outfit night trial before quoting any distance. In-browser ~1 s; photos stay on the phone.

WHO PAYS

Road crews, cleaning contractors and fleets, per audit.

JUDGE DEMO

Photograph a shoe or lanyard with and without flash.

Moat — a field-calibrated index · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [129][130]

RideCoach

Coaches couriers on safe riding using their own phone's camera.

WHAT IT DOES

With the phone on the handlebar, RideCoach checks lights and plate at shift start, then watches for red lights and stop lines during the ride. Couriers get a weekly score and bonuses for safe riding.

WHY IT MATTERS

Most courier fines are for lights, reflectors and passengers, and red-light running causes crashes. Other systems need extra hardware.

USE CASES

- A delivery platform rewards safe couriers
- A courier learns their risky habits
- A platform cuts fines and crashes

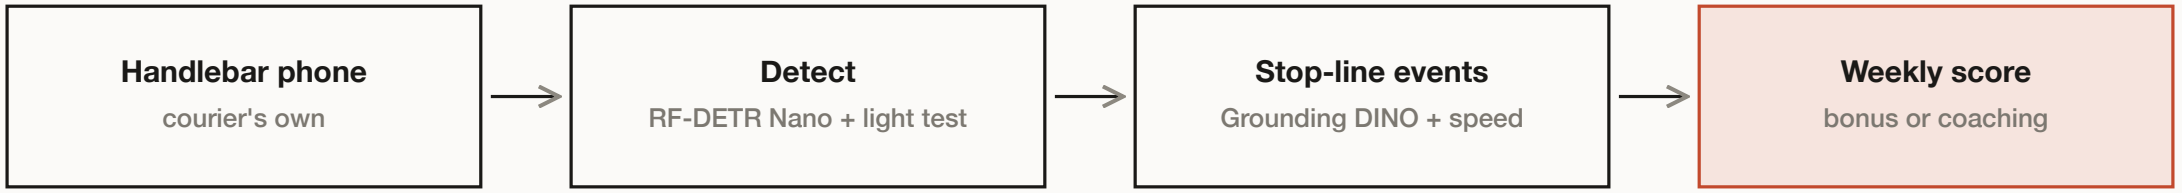

WHO BUYS IT

Delivery platforms.

RideCoach

Shift-start check of a courier's lights and plate plus one riding behaviour: red lights and stop lines.

HOW IT WORKS

WHY IT MATTERS

92% of courier violations involve reflectors, lights, tint or passengers. Drover AI mounts hardware on scooters; this uses couriers' own phones.

HOW PRACTICAL

Consented public POV footage; recall per event. Phone FPS to measure; event clips only.

WHO PAYS

Delivery platforms, 3,000 UZS per active courier-month.

JUDGE DEMO

Point a phone at a laptop ride: red-light run flagged.

Moat — courier-view violation data · Report score 53/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [16][120]

No-Start Doctor

Tests a car battery with a phone video of the headlights during engine start.

WHAT IT DOES

Switch on the headlights and film them while starting the engine. As the battery strains, the lights dim; No-Start Doctor measures the dimming, estimates the battery voltage and warns if it will fail in winter.

WHY IT MATTERS

Weak batteries leave drivers stranded on cold mornings. Testers need hardware; this needs only a phone. It doesn't work with LED headlights.

USE CASES

- A battery shop finds customers who need a new battery
- A taxi park checks batteries before winter
- A driver avoids a no-start morning

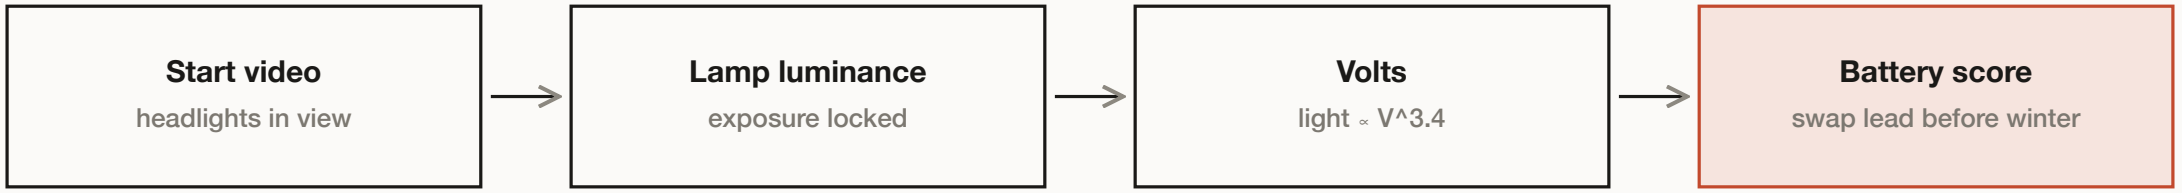

WHO BUYS IT

Battery retailers and taxi parks.

No-Start Doctor

Camera as voltmeter: film the headlights during a start and get a cranking-sag battery score before winter.

HOW IT WORKS

WHY IT MATTERS

Cold-cranking ratings assume ≥7.2 V while cranking; deeper sag means a weak battery. OBD dongles need hardware. LED-only and EV cars are out of scope.

HOW PRACTICAL

Bench halogen on a variable supply; 3–5 cars logged with an OBD voltage PID. Server ~2 s.

WHO PAYS

Battery retailers and taxi parks, ~2,000 UZS per check plus swap leads.

JUDGE DEMO

Film our bench lamp while we sag its voltage.

Moat — paired video and OBD data · Report score 61/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [105][106][107]

CouplingCheck

Checks that a truck and its trailer are coupled correctly before departure.

WHAT IT DOES

The driver films the coupling area from the side for 10 seconds. CouplingCheck confirms the air hoses and electric plug are connected, the support legs are up and the latch is closed, and saves a signed log.

WHY IT MATTERS

A badly coupled trailer can detach on the road and cause a deadly crash. Today checks rely on memory or costly sensors.

USE CASES

- A trucking company logs every departure check
- A cargo insurer requires proof
- A driver catches a missed connection

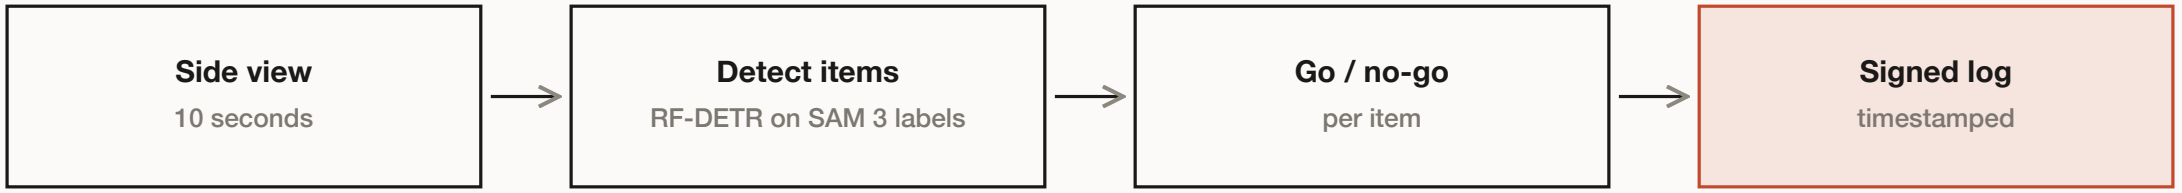

WHO BUYS IT

Cargo insurers and freight companies on the China-Uzbekistan corridor.

CouplingCheck

Signed pre-departure coupling log from a 10-second side view: hoses, plug, landing gear, latch, no gap.

HOW IT WORKS

WHY IT MATTERS

Coupling is verified by vibration sensors today. The kingpin lock needs a look under the trailer, so it is not claimed.

HOW PRACTICAL

200+ own photos from truck yards. Phone WebGPU ~0.3 s, $0 server.

WHO PAYS

Cargo insurers and forwarders on the China–Uzbekistan corridor.

JUDGE DEMO

Unplug a toy hose: fail.

Moat — per-trailer history · Report score 55/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [135][136]

ShadeRent

Maps which parking spots stay in the shade, and for how long.

WHAT IT DOES

A phone fixed above a parking lot takes a photo every 15-30 minutes. ShadeRent marks shaded bays and calculates shade hours per spot, showing where to build canopies, solar carports or chargers.

WHY IT MATTERS

In hot Uzbek summers, shaded spots are worth more and cars stay cooler. The airport lot alone holds about 1,500 vehicles.

USE CASES

- A parking operator charges more for shaded bays
- An installer plans solar carports
- A mall decides where to add shade

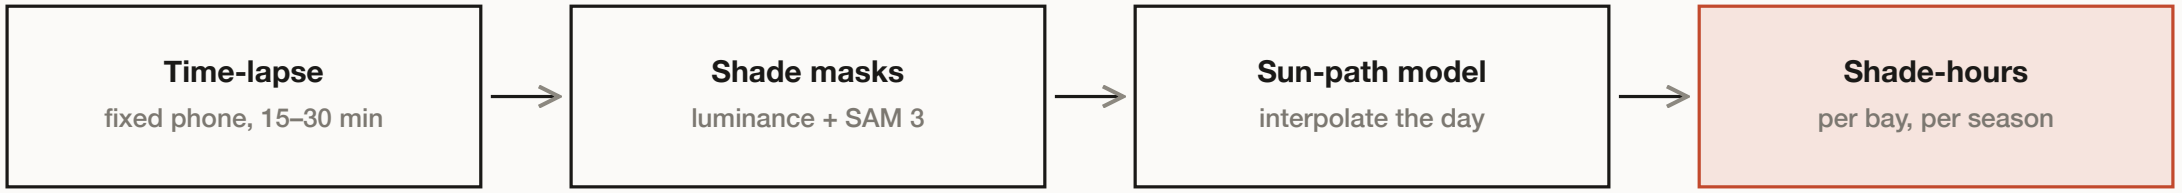

WHO BUYS IT

Parking operators and canopy or solar installers.

ShadeRent

Measured shade maps: a fixed phone shoots a lot every 15–30 minutes to site canopies, solar carports and chargers.

HOW IT WORKS

WHY IT MATTERS

The airport lot holds ~1,500 vehicles at a 48.78bn UZS yearly start price. ShadeMap simulates shadows; this measures them per bay.

HOW PRACTICAL

Own time-lapse shot during the sprint. Server ~$0.05 per lot.

WHO PAYS

Airport lot operator, canopy and solar-carport installers, ~$20+/survey.

JUDGE DEMO

Predicted 16:30 shade over the real 16:30 photo, IoU shown.

Moat — per-bay shade and occupancy history · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [190][191]

ParkOK

Tells a driver whether stopping here is legal, from one photo of the street.

WHAT IT DOES

The driver photographs the kerb ahead. ParkOK reads the signs, markings and paid-parking zone and time windows, and answers green, amber or red, quoting the rule and the fine.

WHY IT MATTERS

Stopping where it is banned costs 880,000 UZS. Courier and taxi drivers stop dozens of times a day and can't read every sign.

USE CASES

- A courier checks a stop before parking
- A fleet cuts its parking fines
- A parking operator licenses the rules data

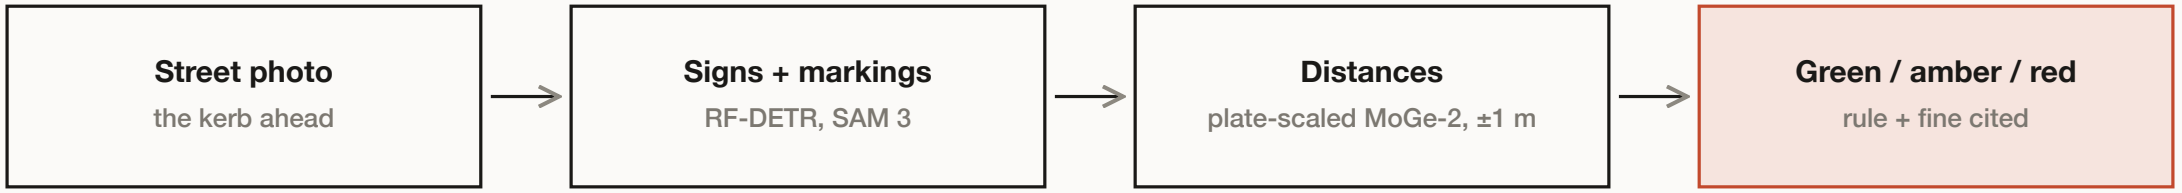

WHO BUYS IT

Courier and taxi fleets.

ParkOK

One-photo stopping check: reads signs, paid zone and time windows and cites the rule and the fine.

HOW IT WORKS

WHY IT MATTERS

Stopping where banned costs 880,000 UZS. US sign-reader apps exist; Uzbek signs derive from GOST, so the rules must be local.

HOW PRACTICAL

600 own kerb photos; Russian sign sets as a proxy. Modal L4 ~2 s, ~$0.002.

WHO PAYS

Fleets ~40,000 UZS per vehicle-month; concessionaire licenses rules.

JUDGE DEMO

Photograph the street outside the venue.

Moat — a geotagged sign corpus · Report score 59/100

Joylash

Shows a building owner where EV chargers would earn money, from their own cameras.

WHAT IT DOES

Joylash watches the venue's parking camera, measures how long cars stay in each bay and how many are electric, and calculates how fast a charger in each spot would pay for itself.

WHY IT MATTERS

Owners don't know if a charger will pay off, so they don't install one. Banks already offer 10% loans for chargers.

USE CASES

- A mall picks the best bays for chargers
- A charger seller qualifies leads
- A hotel builds a business case for charging

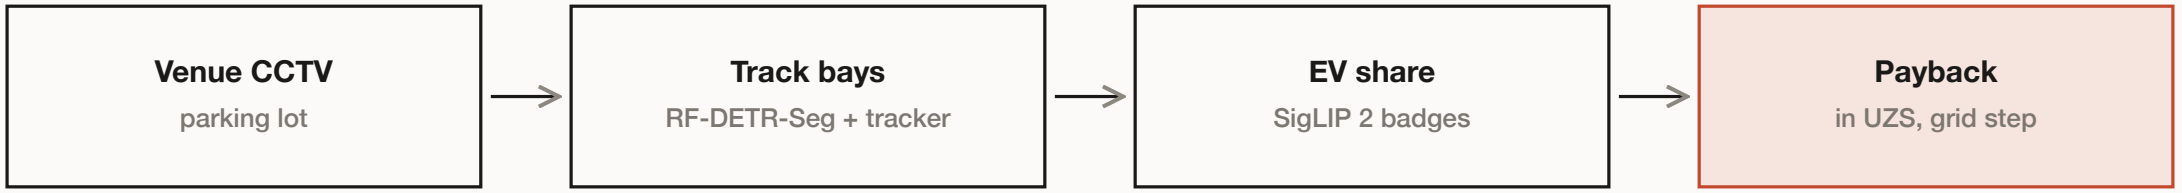

WHO BUYS IT

Charger sellers and installers (success fee).

Joylash

Charger siting from a venue's own CCTV: per-bay dwell and EV share feed a payback simulator.

HOW IT WORKS

WHY IT MATTERS

There were 1,399 stations in May 2025 and banks offer 10% charger loans. Session-data siting tools need chargers to exist first.

HOW PRACTICAL

Consented lot clips; 500 hand-labelled badge crops. T4 or L4 batch, ~$1–2 per lot.

WHO PAYS

Charger distributors and installers, success fee per installed unit.

JUDGE DEMO

Drag a charger-count slider; bays light up.

Moat — a dwell benchmark by venue type · Report score 54/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [177][178][179]

Yard Tetris

Finds any car in a crowded dealer yard and plans the fewest moves to get it out.

WHAT IT DOES

A camera on the roof photographs the yard every few minutes. Yard Tetris knows where each car is, how long it has stood there and which cars block it, and plans the shortest sequence of moves to free it.

WHY IT MATTERS

In big yards, staff waste time searching for cars and shuffling others out of the way, and stock stands longer when sales slow.

USE CASES

- A dealer finds a customer's car in seconds
- A yard manager sees old stock
- Staff move fewer cars per delivery

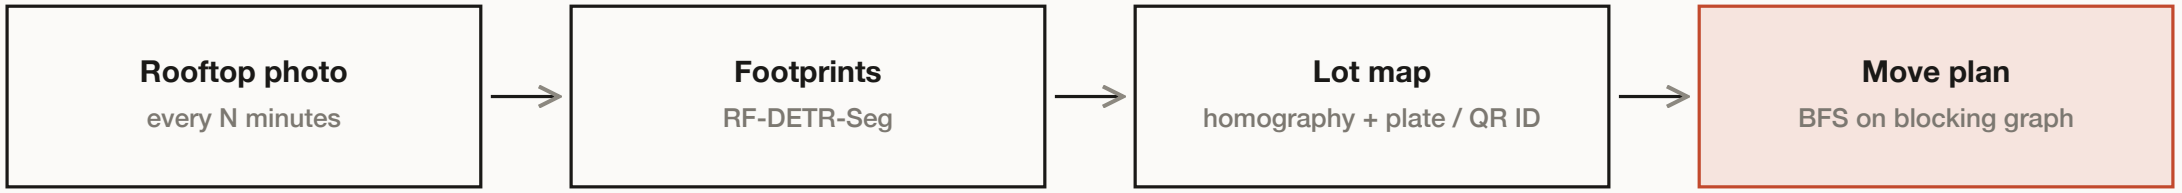

WHO BUYS IT

Car dealers and import yards.

Yard Tetris

A rooftop photo every few minutes shows where car X is, how long it sat and who blocks it, plus a minimal-moves plan.

HOW IT WORKS

WHY IT MATTERS

New-car sales fell 3.6% in Jan–Jul 2026, so stock sits longer. Cox Lot Vision is GPS/OBD; this is camera-only.

HOW PRACTICAL

COCO weights plus photos of two real yards; measure find-time saved. In-browser nano segmenter; solver under 50 ms.

WHO PAYS

Dealers and import yards, ~$50–80 per lot-month.

JUDGE DEMO

Snap a toy-car grid, tap a car: move sequence.

Moat — lot layout and dwell history · Report score 53/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [50][121]

DarkRoad

Warns night drivers about carts, tractors and animals on rural roads.

WHAT IT DOES

Fleet dashcams record rural routes during the day and at dusk. DarkRoad finds slow carts, tractors and livestock on the roadside, maps where they usually are, and warns drivers on night trips through those spots.

WHY IT MATTERS

Unlit slow vehicles and animals cause deadly night crashes. Some regions ban heavy trucks by day, pushing them into night driving.

USE CASES

- An intercity bus company warns drivers
- A trucking firm plans safer night routes
- An insurer prices route risk

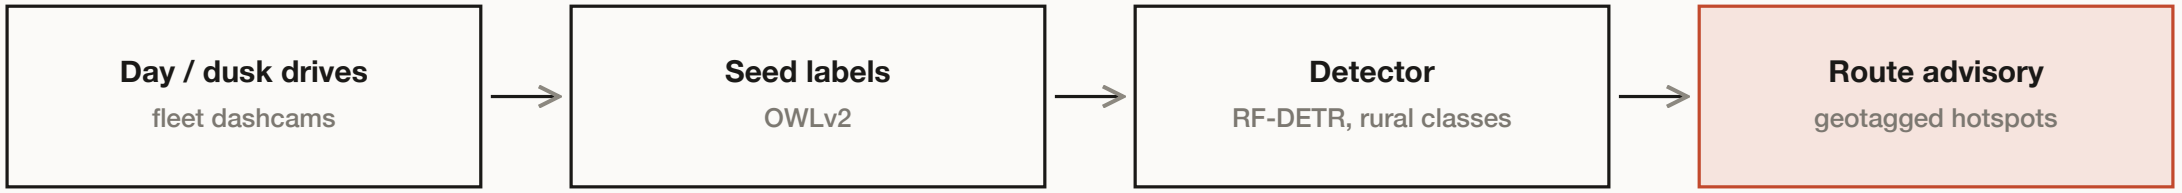

WHO BUYS IT

Intercity bus and trucking fleets; insurers buy risk reports.

DarkRoad

Route-level night-hazard map: carts, tractors and livestock on shoulders found by day and dusk, warned about at night.

HOW IT WORKS

WHY IT MATTERS

Surkhandarya bans heavy trucks 10:00–19:00, pushing them into the night. Night fleet dashcams exist; local slow road users are unlabelled.

HOW PRACTICAL

Own day and dusk drives; ZOD and ACDC night frames for evaluation. Quantized phone detector, FPS to measure.

WHO PAYS

Fleets ~60k UZS per vehicle-month; insurers buy route-risk reports.

JUDGE DEMO

Open a rural clip: hazards plus the map.

Moat — non-Western road-user data · Report score 55/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [118][119]

LoadGate

Checks a truck's load size and cover at the site exit before it hits the road.

WHAT IT DOES

At the quarry or building site exit, two photos are taken from the side and back. LoadGate measures how far the load sticks out and how high it is, compares that with the legal limit, and checks the load is covered.

WHY IT MATTERS

Overhanging and uncovered loads cause crashes and dust. The exact Uzbek overhang limit still needs to be confirmed before use.

USE CASES

- A quarry sends out only legal loads
- A developer keeps proof for smog inspectors
- A haulier avoids fines

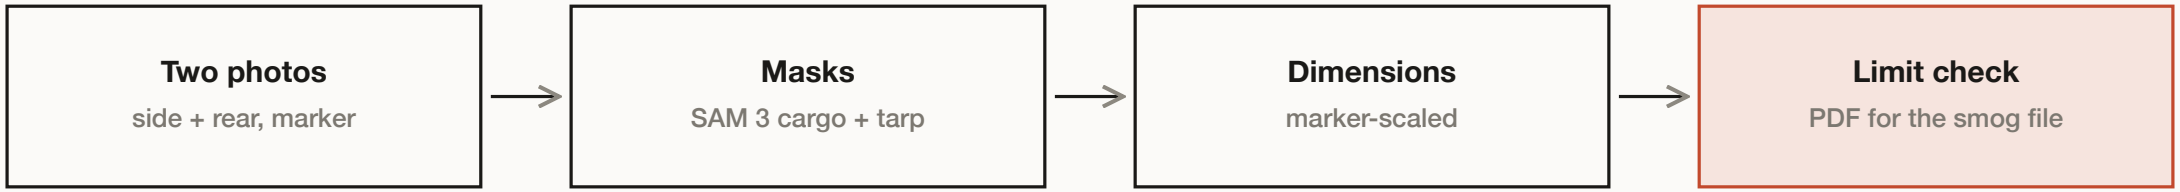

WHO BUYS IT

Quarries and construction developers.

LoadGate

Exit-gate pass from a side and rear photo pair: overhang, height and width against the legal limit, plus a tarp check.

HOW IT WORKS

WHY IT MATTERS

The Uzbek overhang limit was not found: source it first. Fraunhofer's photo check covers straps, not dimensions and tarp. Pairs with GateWash.

HOW PRACTICAL

60–100 self-shot loads, tape-measured on 20+ trucks. Server T4 ~3 s, ~$0.001.

WHO PAYS

Developers and quarries, ~$10 per vehicle-month.

JUDGE DEMO

Photograph a toy truck with overhanging sticks.

Moat — a local rules library · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [112]

WeldTell

Tells factory welds from repair welds in photos, to reveal hidden body repairs.

WHAT IT DOES

The inspector photographs one standard spot, such as the door frame. WeldTell compares the welds and sealant with factory-original examples of the same model and highlights areas that look like repair work for a person to check.

WHY IT MATTERS

Structural repairs after a serious crash are often hidden, and they make a car less safe. Only experts can spot them today.

USE CASES

- An inspector checks the door frame for repair welds
- A dealer screens trade-ins for major crashes
- A buyer avoids a rebuilt car

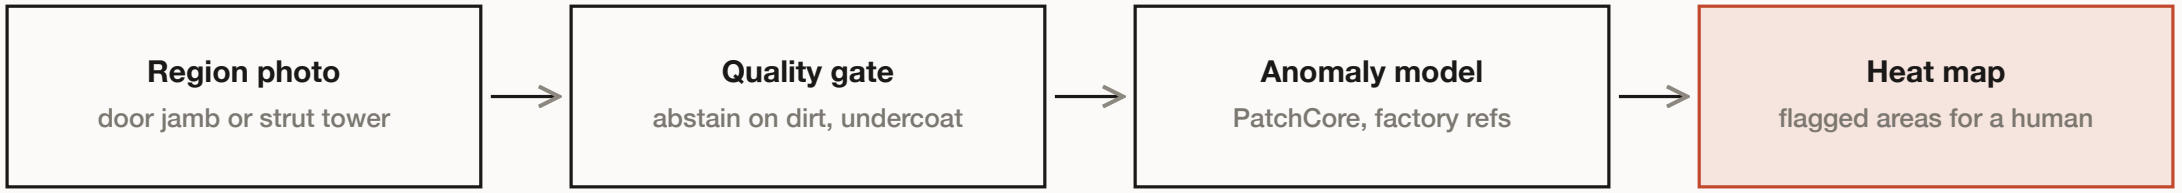

WHO BUYS IT

Car inspectors and dealers.

WeldTell

Heat map separating factory spot welds and seam sealer from repair welds on one repeatable region of two models.

HOW IT WORKS

WHY IT MATTERS

Vendor guides list weld tells and rate AI only "partial". Factory references need dealer access, which is also the moat.

HOW PRACTICAL

Factory-new references at a sponsor dealer; 40 labelled panels; AUC reported. CPU ~0.3 s per patch.

WHO PAYS

Avtopodbor firms and dealers, ~20,000 UZS per car.

JUDGE DEMO

Photograph our factory vs repaired sample jambs.

Moat — per-model factory references · Report score 58/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [52][53]

DateCode Detective

Reads the date stamps on glass, belts and tyres to show which parts were replaced.

WHAT IT DOES

Every car window, seatbelt and tyre carries a small production date. DateCode Detective reads these stamps from photos and compares them with the car's build year; a part much newer than the car was probably replaced.

WHY IT MATTERS

A replaced windscreen or belt can mean a past accident. Sellers can prove originality, and buyers can spot hidden history.

USE CASES

- A seller proves all glass is original
- A buyer finds a replaced windscreen
- A dealer adds an originality certificate

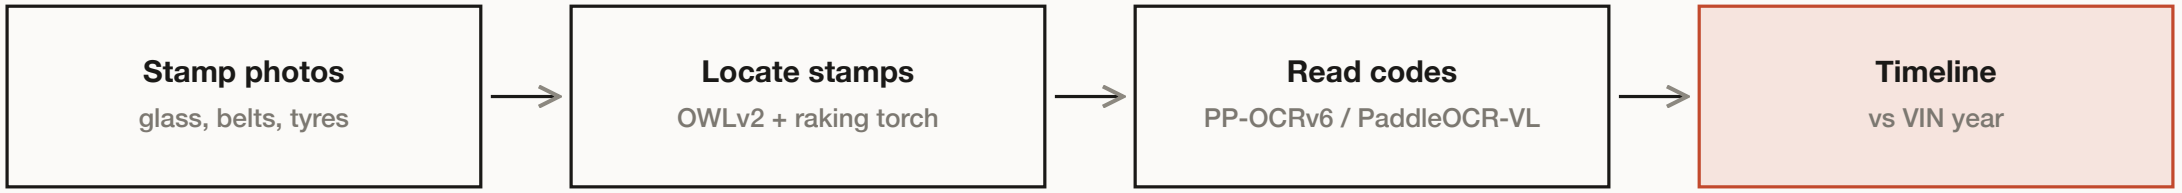

WHO BUYS IT

Dealers and trade-in desks.

DateCode Detective

Seller-side originality certificate: glass, seat-belt and VIN-plate date codes consistent with the build year.

HOW IT WORKS

WHY IT MATTERS

Anyline reads tyre DOT codes; every dated part together tells the car's replacement story. Tyre age is the live demo hook.

HOW PRACTICAL

150+ real stamps with a per-source read-rate table, including "unreadable". Tyre OCR in browser; hard stamps ~$0.0003 via VLM.

WHO PAYS

Dealers and trade-in desks, ~20,000 UZS per car.

JUDGE DEMO

Photograph any tyre sidewall in the car park.

Moat — decoder tables for glass makers seen locally · Report score 57/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [54][55]

RepaintRadar

Shows which car panels were repainted, so inspectors know where to measure.

WHAT IT DOES

Sweep a phone torch over each panel for 20 seconds. RepaintRadar compares the paint's texture and colour with neighbouring panels and ranks the three panels most likely repainted, for checking with a paint gauge.

WHY IT MATTERS

Repaint usually hides damage. In one study, about 38% of 15,236 cars had unrecorded repairs.

USE CASES

- An inspector checks the right panels first
- A buyer screens a car before inspection
- A trade-in desk prices repainted cars fairly

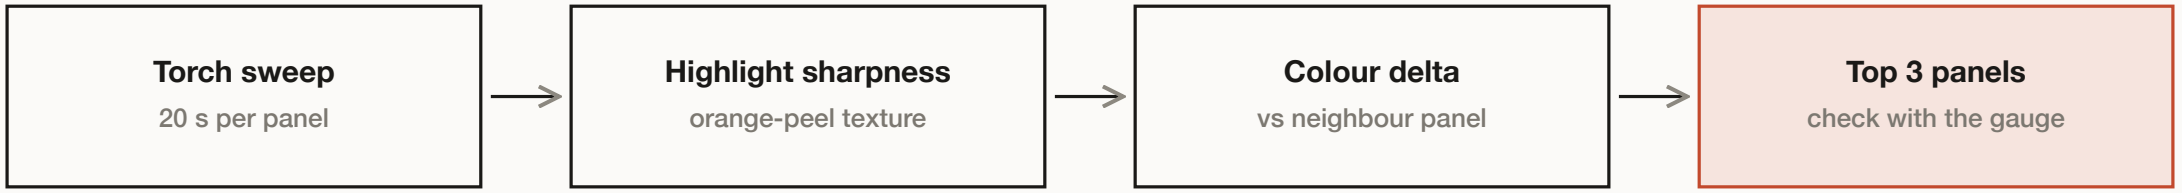

WHO BUYS IT

Car inspectors, trade-in desks and buyers.

RepaintRadar

Triage before the paint gauge: a 20-second torch sweep per panel ranks the three panels worth checking.

HOW IT WORKS

WHY IT MATTERS

Heydealer found unrecorded repairs on ~38% of 15,236 cars. Oto Dedektif claims repaint flags: publish a head-to-head.

HOW PRACTICAL

Cheap-gauge labels on 40 cars × 12 panels; held-out-car AUC. In-browser ~1 s per panel; abstains on dark metallics.

WHO PAYS

Inspectors and trade-in desks 15,000 UZS per car; buyers 5,000 UZS.

JUDGE DEMO

Sweep a torch over a glossy door.

Moat — gauge-labelled local finishes · Report score 55/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [56][57]

Podstava Radar

Measures braking in dashcam video to help settle staged rear-end crashes.

WHAT IT DOES

Before a rear-end crash, the dashcam shows how the car in front behaved. Podstava Radar measures the distance, when the brake lights came on and how fast the gap closed, and builds a timeline. It reports facts only, not who is guilty.

WHY IT MATTERS

In staged crashes ("podstava"), a car brakes suddenly so you hit it. Clear measurements help taxi drivers and insurers settle such disputes.

USE CASES

- A taxi park defends a driver in a dispute
- An insurer reviews a suspicious rear-end claim
- A driver shows the car ahead braked without reason

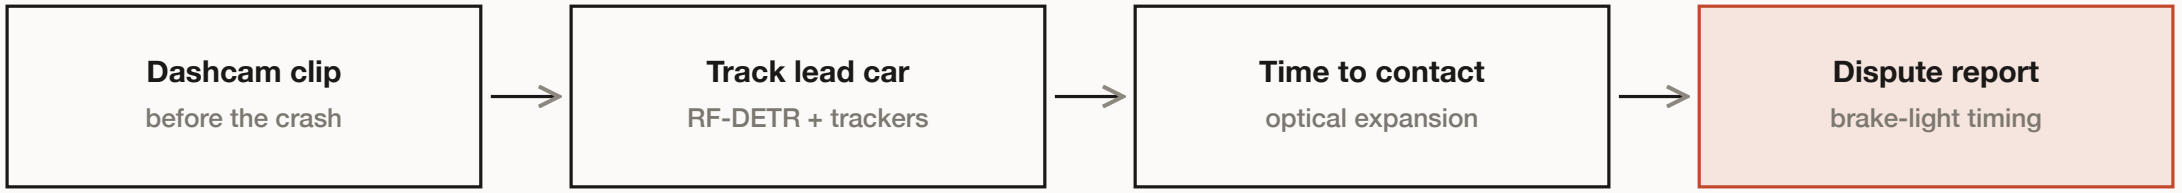

WHO BUYS IT

Taxi parks and insurers.

Podstava Radar

Measurement-only braking-and-headway timeline from a dashcam clip before a rear-end crash; no scam verdict.

HOW IT WORKS

WHY IT MATTERS

Staged rear-end crashes ("podstava") turn on who braked and why. GoFleet markets brake-check flags without validation; an open, measured timeline is the twist.

HOW PRACTICAL

DoTA, CCD and Nexar clips, CARLA scenes; validate against GPS on ~5 drives. T4 ~5 s per 15 s clip. Interview two taxi parks first.

WHO PAYS

Taxi parks ~$1 per car-month; insurers ~$0.50 per clip.

JUDGE DEMO

Upload a dashcam clip: deceleration chart.

Moat — a local scenario library · Report score 53/100

Report: Automotive CV hackathon ideas (10 Oct 2026), refs [65]

How to pitch any of these

Lead with the money: who pays, how much, how often.

Put revenue math on one slide; cost per inspection is $0.0003–0.01, so gross margin can top 90%. Name a design partner in the room (MKBANK, Uzcard, BYD Royal Motors, the Central Bank). Show the path from one module to a platform and the next two markets.

What is still unverified

Every price is an estimate; no customer has confirmed they would pay.

Some facts rest on one weak source: the UZS rate, "1,700 fines in 3 days", Cobalt's 30.1% share. No source was found for the helmet rule, truck overhang limit, minimum yellow time or a CNG passenger-exit rule. Phone-browser speeds are unmeasured.
